|----------------------------------------------------------------------------------------|----|
| INTRODUCTION .....                                                                     | 10 |
| 1 PRODUCT DESCRIPTION .....                                                            | 11 |
| 1.1 Purpose .....                                                                      | 11 |
| 1.2 Switch features.....                                                               | 12 |
| 1.2.1 Basic features.....                                                              | 12 |
| 1.2.2 MAC address processing features.....                                             | 12 |
| 1.2.3 Layer 2 features .....                                                           | 12 |
| 1.2.4 Layer 3 features .....                                                           | 14 |
| 1.2.5 QoS features .....                                                               | 14 |
| 1.2.6 Security features .....                                                          | 14 |
| 1.2.7 Switch control features.....                                                     | 15 |
| 1.2.8 Additional features .....                                                        | 16 |
| 1.3 Main specifications .....                                                          | 16 |
| 1.4 Design.....                                                                        | 35 |
| 1.4.1 Layout and description of the front panels .....                                 | 35 |
| 1.4.2 Rear and top panels of the devices.....                                          | 47 |
| 1.4.3 Side panels of the device .....                                                  | 50 |
| 1.4.4 MES3708P switch design .....                                                     | 51 |
| 1.4.5 Light indication.....                                                            | 52 |
| 1.5 Delivery package .....                                                             | 54 |
| 2 INSTALLATION AND CONNECTION .....                                                    | 55 |
| 2.1 Device rack installation .....                                                     | 55 |
| 2.2 MES3710P DIN rail installation .....                                               | 57 |
| 2.3 Connection to power supply .....                                                   | 57 |
| 2.4 SFP transceiver installation and removal.....                                      | 58 |
| 3 INITIAL SWITCH CONFIGURATION .....                                                   | 60 |
| 3.1 Hotkeys.....                                                                       | 60 |
| 3.2 Terminal configuration.....                                                        | 60 |
| 3.3 Turning on the device .....                                                        | 60 |
| 3.4 Startup menu .....                                                                 | 61 |
| 3.5 Switch function configuration.....                                                 | 62 |
| 3.5.1 Automatic configuration of switch parameters (Zero Touch Provisioning).....      | 62 |
| 3.5.2 Basic switch configuration .....                                                 | 62 |
| 3.5.3 Security system configuration .....                                              | 64 |
| 4 DEVICE MANAGEMENT. COMMAND LINE INTERFACE.....                                       | 66 |
| 4.1 Basic commands.....                                                                | 66 |
| 4.2 Filtering command line messages.....                                               | 67 |
| 4.3 Configuring macro commands .....                                                   | 68 |
| 4.4 System management commands.....                                                    | 69 |
| 4.5 Password parameters configuration commands .....                                   | 73 |
| 4.6 File operations.....                                                               | 73 |
| 4.6.1 Command parameters description .....                                             | 73 |
| 4.6.2 File operation commands .....                                                    | 74 |
| 4.6.3 Configuration backup commands .....                                              | 75 |
| 4.7 System time configuration .....                                                    | 76 |
| 4.8 Interfaces and VLAN configuration .....                                            | 78 |
| 4.8.1 Ethernet, Port-Channel and Loopback interface parameters.....                    | 78 |
| 4.8.2 Configuring VLANs and interface switching modes .....                            | 81 |
| 4.9 Selective Q-in-Q .....                                                             | 87 |
| 4.10 Storm control for different traffic (broadcast, multicast, unknown unicast) ..... | 88 |
| 4.11 Link Aggregation Groups (LAG) .....                                               | 89 |

|        |                                                                          |     |
|--------|--------------------------------------------------------------------------|-----|
| 4.11.1 | Static link aggregation groups .....                                     | 90  |
| 4.11.2 | LACP link aggregation protocol.....                                      | 91  |
| 4.12   | IPv4 addressing configuration .....                                      | 92  |
| 4.13   | IPv6 addressing configuration .....                                      | 93  |
| 4.13.1 | IPv6 protocol.....                                                       | 93  |
| 4.13.2 | IPv6 configuration.....                                                  | 93  |
| 4.14   | Protocol configuration .....                                             | 95  |
| 4.14.1 | ARP configuration .....                                                  | 95  |
| 4.14.2 | Loopback detection mechanism .....                                       | 96  |
| 4.14.3 | STP (STP, RSTP, MSTP, RPVST+) .....                                      | 97  |
| 4.14.4 | Configuring Layer 2 Protocol Tunneling (L2PT) function .....             | 104 |
| 4.14.5 | LLDP configuration.....                                                  | 106 |
| 4.14.6 | Configuring G.8032v2 (ERPS) .....                                        | 110 |
| 4.15   | Configuring OAM .....                                                    | 113 |
| 4.16   | Multicast addressing.....                                                | 115 |
| 4.16.1 | Intermediate function of IGMP (IGMP Snooping) .....                      | 115 |
| 4.16.2 | Multicast addressing rules.....                                          | 121 |
| 4.16.3 | MLD snooping is a protocol for multicast traffic monitoring in IPv6..... | 121 |
| 4.16.4 | Multicast traffic restriction functions .....                            | 123 |
| 4.16.5 | IGMP proxy configuration.....                                            | 124 |
| 4.17   | Management functions.....                                                | 125 |
| 4.17.1 | AAA mechanism.....                                                       | 125 |
| 4.17.2 | RADIUS.....                                                              | 128 |
| 4.17.3 | TACACS+.....                                                             | 129 |
| 4.17.4 | ACLs for device management .....                                         | 130 |
| 4.17.5 | Configuring management protocols .....                                   | 131 |
| 4.18   | Alarm log, SYSLOG protocol .....                                         | 135 |
| 4.19   | Port mirroring (monitoring) .....                                        | 137 |
| 4.20   | Physical layer diagnostic functions .....                                | 138 |
| 4.20.1 | Copper-wire cable diagnostics.....                                       | 138 |
| 4.20.2 | Power supply via Ethernet lines (PoE) .....                              | 139 |
| 4.20.3 | UDLD protocol .....                                                      | 140 |
| 4.20.4 | Optical transceiver diagnostics.....                                     | 141 |
| 4.21   | Security features .....                                                  | 141 |
| 4.21.1 | Port security functions.....                                             | 141 |
| 4.21.2 | DHCP management and Option 82.....                                       | 143 |
| 4.21.3 | DSLAM Controller Solution (DCS) .....                                    | 144 |
| 4.21.4 | IP Source Guard .....                                                    | 148 |
| 4.21.5 | ARP Inspection .....                                                     | 149 |
| 4.21.6 | Configuring MAC Address Notification function .....                      | 150 |
| 4.21.7 | Port based client authentication (802.1x standard).....                  | 151 |
| 4.21.8 | Configuring the IPv6 RA Guard function.....                              | 154 |
| 4.21.9 | Configuring the IPv6 ND Inspection function .....                        | 156 |
| 4.22   | DHCP Relay Agent functions .....                                         | 158 |
| 4.23   | DHCP server configuration.....                                           | 159 |
| 4.24   | PPPoE Intermediate Agent configuration .....                             | 171 |
| 4.25   | Access Control List (ACL) configuration .....                            | 172 |

| <b>&lt;Bold italics&gt;</b>                                           | Keyboard keys are shown in bold italic within angle brackets.                                                                |
| <b>Courier New</b>                                                    | Command examples are shown in Courier New Bold.                                                                              |
| <div style="border: 1px solid black; padding: 2px;">Courier New</div> | Command execution results are shown in Courier New in a frame with a shadow border.                                          |

## NOTES AND WARNINGS

**Notes** contain important information, tips, or recommendations on device operation and configuration.

**Warnings** are used to inform the user about situations that could harm the device or the user, cause the device to malfunction or lead to data loss.

## INTRODUCTION

In recent years, large-scale projects on the construction of telecommunications networks are implemented in accordance with the concept of NGN (next generation networks). One of the main tasks of the large multiservice network construction is the creation of reliable and high-performance transport networks, which are the backbone in the multilayer NGN architecture.

Gigabit Ethernet (GE) technologies are largely used to obtain high data transmission rates. High-speed data transmission, especially in large-scale networks, requires a network topology that will allow flexible distribution of high-speed data flows.

MES14xx, MES24xx, MES34xx and MES3708P series switches can be used in large enterprise networks, SMB networks and carrier networks. These switches deliver high performance, flexibility, security, and hierarchical QoS.

Industrial switches MES3400I-24, MES3708P, MES3710P are designed to organize secure fault-tolerant networks for data transmission on the sites where it is required to meet the requirements for ensuring resistance to various effects (thermal, mechanical, etc.).

This user manual describes intended use, specifications, first-time set-up recommendations, and the syntax of commands used for configuration, monitoring and firmware update of the switches.

# 1 PRODUCT DESCRIPTION

## 1.1 Purpose

MES14xx and MES24xx are managed switches which implement switching on channel and network levels of the OSI model.

Ethernet switches MES1428 are equipped with 24 electric ports of Fast Ethernet and 4 optic ports of Gigabit Ethernet for SFP transceivers (Combo ports).

Ethernet switches MES2408x are equipped with 8 electric ports of Gigabit Ethernet and 2 optic ports of Gigabit Ethernet for SFP transceivers.

Ethernet switches MES2411X are equipped with 8 electric ports of Gigabit Ethernet and 11 optic ports of TenGigabit Ethernet for SFP+ transceivers.

Ethernet switches MES2420B-24D are equipped with 24 electric ports of 2.5 Gigabit Ethernet and 4 optic ports of TenGigabit Ethernet for SFP+ transceivers.

Ethernet switches MES2428x are equipped with 24 electric ports of Gigabit Ethernet and 4 optic ports of Gigabit Ethernet for SFP transceivers (Combo ports).

Ethernet switches MES2424x, MES3400-24 and MES3400I-24 are equipped with 24 electric ports of Gigabit Ethernet and 4 optic ports of TenGigabit Ethernet for SFP+ transceivers.

Ethernet switches MES2410-08DU, MES2410-08DP are equipped with 8 electric ports of 2.5 Gigabit Ethernet and 2 optic ports of TenGigabit Ethernet for SFP+ transceivers.

Ethernet switches MES2424FB are equipped with 24 optic ports of Gigabit Ethernet for installing SFP transceivers and 4 optic ports of TenGigabit Ethernet for SFP+ transceivers.

Ethernet switches MES2420-48P, MES2448 DC, MES2448B, MES2448P are equipped with 48 electric ports of Gigabit Ethernet and 4 optic ports of TenGigabit Ethernet for SFP+ transceivers.

Ethernet switches MES3400-24F are equipped with 24 optic ports of Gigabit Ethernet for SFP transceivers and 4 optic ports of TenGigabit Ethernet for SFP+ transceivers.

Ethernet switches MES3400-48 are equipped with 48 electric ports of Gigabit Ethernet and 4 optic ports of 4 TenGigabit Ethernet for SFP+ transceivers.

Ethernet switches MES3400-48F are equipped with 48 optic ports of Gigabit Ethernet for SFP transceivers and 4 optic ports of TenGigabit Ethernet for SFP+ transceivers.

Ethernet switches MES3708P are equipped with 8 electric ports of Gigabit Ethernet and 2 optic ports of Gigabit Ethernet for SFP transceivers.

Ethernet switches MES3710P are equipped with 8 electric ports of Gigabit Ethernet and 4 optic ports of Gigabit Ethernet for SFP transceivers.

## 1.2 Switch features

### 1.2.1 Basic features

Table 1 lists the basic administrable features of the devices.

Table 1 — Basic features of the device

|                                    |                                                                                                                                                                                                  |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Head-of-Line blocking (HOL)</b> | HOL blocking occurs when device output ports are overloaded with traffic coming from input ports. It may lead to data transmission delays and packet loss.                                       |
| <b>Jumbo frames</b>                | Enable jumbo frame transmission to minimize the amount of transmitted packets. This reduces overhead, processing time and interruptions.                                                         |
| <b>Flow control (IEEE 802.3X)</b>  | Allow interconnecting low-speed and high-speed devices. To avoid buffer overrun, the low-speed device can send PAUSE packets that will force the high-speed device to pause packet transmission. |

### 1.2.2 MAC address processing features

Table 2 lists MAC address processing features.

Table 2 — MAC address processing features

|                                          |                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MAC address table</b>                 | The switch creates an in-memory table which contains mac-addresses and due ports.                                                                                                                                                                                                                                                                                                           |
| <b>Learning mode</b>                     | When learning is not available, data received on a port will be transmitted to all other ports of the switch. Learning mode allows the switch to analyse a frame, discover sender's MAC address and add it to a routing table. Then, if the destination MAC address of an Ethernet frames is already in the routing table, that frame will be sent only to the port specified in the table. |
| <b>MAC Multicast Support</b>             | This feature enables one-to-many and many-to-many data distribution. Thus, the frame addressed to a multicast group will be transmitted to each port of the group.                                                                                                                                                                                                                          |
| <b>Automatic Aging for MAC Addresses</b> | If there are no packets from a device with a specific MAC address in a specific period, the entry for this address expires and will be removed. It keeps the switch table up to date.                                                                                                                                                                                                       |
| <b>Static MAC Entries</b>                | The network switch allows defining static MAC entries that will be saved in the routing table.                                                                                                                                                                                                                                                                                              |

### 1.2.3 Layer 2 features

Table 3 lists OSI layer 2 features and special aspects.

Table 3 — OSI layer 2 features description

|                                                           |                                                                                                                                                                                |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IGMP Snooping (Internet Group Management Protocol)</b> | IGMP implementation analyses the contents of IGMP packets and discovers network devices participating in multicast groups and forwards the traffic to the corresponding ports. |
| <b>MLD Snooping (Multicast Listener Discovery)</b>        | MLD protocol implementation allows the device to minimize multicast IPv6 traffic.                                                                                              |
| <b>MVR (Multicast VLAN Registration)</b>                  | This feature can redirect multicast traffic from one VLAN to another using IGMP messages to reduce uplink port load. Used in III-play solutions.                               |

|                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Storm Control<br/>(Broadcast, multicast,<br/>unknown unicast Storm<br/>Control)</b>        | Storm is a multiplication of broadcast, multicast, unknown unicast messages in each host causing their exponential growth that can lead to the network failure. The switches can limit the transmission rate for multicast and broadcast frames received and sent by the switch.                                                                                                                                                                                                               |
| <b>Port<br/>Mirroring</b>                                                                     | Port mirroring is used to duplicate the traffic on monitored ports by sending ingress or and/or egress packets to the controlling port. Switch users can define controlled and controlling ports and select the type of traffic (ingress or egress) that will be sent to the controlling port.                                                                                                                                                                                                 |
| <b>Protected ports</b>                                                                        | This feature assigns the uplink port to the switch port. This uplink port will receive all the traffic and provide isolation from other ports (in a single switch) located in the same broadcast domain (VLAN).                                                                                                                                                                                                                                                                                |
| <b>STP (Spanning Tree<br/>Protocol)</b>                                                       | Spanning Tree Protocol is a network protocol that ensures loop-free network topology by converting networks with redundant links to a spanning tree topology. Switches exchange configuration messages using frames in a specific format and selectively enable or disable traffic transmission to ports.                                                                                                                                                                                      |
| <b>RSTP<br/>(IEEE 802.1w Rapid<br/>Spanning Tree Protocol)</b>                                | Rapid STP (RSTP) is the enhanced version of STP that enables faster convergence of a network to a tree topology and provides higher stability.                                                                                                                                                                                                                                                                                                                                                 |
| <b>ERPS (Ethernet Ring<br/>Protection Switch)<br/>protocol</b>                                | The protocol is used for increasing stability and reliability of data transmission network having ring topology by reducing recovery network time in case of break-down. Recovery time does not exceed 1 second. It is much less than network change over time in case of spanning tree protocols usage.                                                                                                                                                                                       |
| <b>VLAN</b>                                                                                   | VLAN is a group of switch ports that form a single broadcast domain. The switch supports various packet classification methods to identify the VLAN they belong to.                                                                                                                                                                                                                                                                                                                            |
| <b>OAM<br/>(Operation,<br/>Administration and<br/>Maintenance,<br/>IEEE 802.3ah) protocol</b> | Ethernet OAM (Operation, Administration, and Maintenance), IEEE 802.3ah – functions of data transmission channel level correspond to channel status monitor protocol. The protocol uses OAM (OAMPDU) protocol data blocks to transmit channel status information between directly connected Ethernet devices. Both devices should support IEEE 802.3ah.                                                                                                                                        |
| <b>Port based<br/>VLAN</b>                                                                    | Distribution to VLAN groups is performed according to the ingress ports. This solution ensures that only one VLAN group is used on each port.                                                                                                                                                                                                                                                                                                                                                  |
| <b>802.1Q support</b>                                                                         | IEEE 802.1Q is an open standard that describes the traffic tagging procedure for VLAN inheritance information transmission. It allows multiple VLAN groups to be used on one port.                                                                                                                                                                                                                                                                                                             |
| <b>Link aggregation with<br/>LACP</b>                                                         | LACP enables automatic aggregation of separate links between two devices (switch-switch or switch-server) in a single data communication channel.<br>The protocol constantly monitors whether link aggregation is possible; in case one link in the aggregated channel fails, its traffic will be automatically redistributed to functioning components of the aggregated channel.                                                                                                             |
| <b>LAG (Link Aggregation<br/>Group) creation</b>                                              | The device allows creating link aggregation groups. Link aggregation, trunking or IEEE 802.3ad is a technology that enables aggregation of multiple physical links into one logical link. This leads to greater bandwidth and reliability of the backbone 'switch-switch' or 'switch-server' channels. There are three types of balancing, based on MAC addresses, IP addresses or destination port (socket).<br>A LAG group contains ports with the same speed operating in full-duplex mode. |
| <b>Selective Q-in-Q</b>                                                                       | Allows assigning external VLAN SPVLAN (Service Provider's VLAN) based on configured filtering rules by internal VLAN numbers (Customer VLAN). Selective Q-in-Q allows breaking down subscriber's traffic into several VLANs and changing SPVLAN tag for the packet in the specific network section.                                                                                                                                                                                            |

### 1.2.4 Layer 3 features

Table 4 lists OSI layer 3 features.

Table 4 — OSI Layer 3 features description

|                                                                     |                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Static IP routes</b>                                             | The switch administrator can add or remove static entries into/from the routing table.                                                                                                                                                                                                                        |
| <b>BootP and DHCP (Dynamic Host Configuration Protocol) clients</b> | The devices can obtain IP address automatically via the BootP/DHCP.                                                                                                                                                                                                                                           |
| <b>ARP (Address Resolution Protocol)</b>                            | ARP maps the IP address and the physical address of the device. The mapping is established on the basis of the network host response analysis; the host address is requested by a broadcast packet.                                                                                                           |
| <b>IGMP proxy function</b>                                          | IGMP Proxy is a feature that allows simplified routing of multicast data between networks. IGMP is used for routing management.                                                                                                                                                                               |
| <b>VRRP (Virtual Router Redundancy Protocol)</b>                    | VRRP is designed for backup of routers acting as default gateways. This is achieved by joining IP interfaces of the group of routers into one virtual interface which will be used as the default gateway for the computers of the network.                                                                   |
| <b>OSPFv2 Protocol</b>                                              | A dynamic routing protocol that is based on a link-state technology and uses Dijkstra's algorithm to find the shortest route. The OSPF protocol is an Internal Gateway Protocol (IGP). The OSPFv2 protocol distributes information about available IPv4 routes between routers of the same autonomous system. |
| <b>OSPFv3 Protocol</b>                                              | The OSPFv3 protocol distributes information about available IPv6 routes between routers of the same autonomous system.                                                                                                                                                                                        |
| <b>RIP</b>                                                          | RIP (Routing Information Protocol) is a routing information protocol belonging to internal distance-vector type routing protocols.                                                                                                                                                                            |

### 1.2.5 QoS features

Table 5 lists the basic Quality of Service features.

Table 5 — Basic Quality of Service features

|                                            |                                                                                                                                                                                                                                                                           |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Priority queues support</b>             | The switch supports egress traffic prioritization with queues for each port. Packets are distributed into queues by classifying them by various fields in packet headers.                                                                                                 |
| <b>Support for 802.1p class of service</b> | 802.1p standard specifies the method for indicating and using frame priority to ensure on-time delivery of time-critical traffic. 802.1p standard defines 8 priority levels. The switches can use the 802.1p priority value to distribute frames between priority queues. |

### 1.2.6 Security features

Table 6 — Security features

|                       |                                                                                                                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DHCP Snooping</b>  | A switch feature designed for protection from attacks using DHCP protocol. Enables filtering of DHCP messages coming from untrusted ports by building and maintaining DHCP snooping binding database. DHCP snooping performs firewall functions between untrusted ports and DHCP servers. |
| <b>DHCP Option 82</b> | An option to tell the DHCP server about the DHCP relay and port of the incoming request.<br>By default, the switch with DHCP snooping feature enabled identifies and drops all DHCP requests containing Option 82, if they were received via an untrusted port.                           |

|                                               |                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dynamic ARP Inspection (Protection)</b>    | A switch feature designed for protection from ARP attacks. The switch checks the message received from the untrusted port: if the IP address in the body of the received ARP packet matches the source IP address. If these addresses do not match, the switch drops this packet. |
| <b>L2 – L3 – L4 ACL (Access Control List)</b> | Using information from the level 2, 3, 4 headers, the administrator can configure up to 100 rules for processing or dropping packets.                                                                                                                                             |
| <b>IP Source address guard</b>                | The switch feature that restricts and filters IP traffic according to the mapping table from the DHCP snooping database and statically configured IP addresses. This feature is used to prevent IP address spoofing.                                                              |

### 1.2.7 Switch control features

Table 7 — Switch control features

|                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Uploading and downloading the configuration file</b> | Device parameters are saved into the configuration file that contains configuration data for each device port as well as for the whole system.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>TFTP (Trivial File Transfer Protocol)</b>            | The TFTP is used for file read and write operations. This protocol is based on UDP transport protocol. Devices are able to download and transfer configuration files and firmware images via this protocol.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>SNMP (Simple Network Management Protocol)</b>        | SNMP is used for monitoring and management of network devices. To control system access, the community entry list is defined where each entry contains access privileges.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>CLI (Command Line Interface)</b>                     | Switches can be managed using CLI locally via serial port RS-232, or remotely via Telnet. Console command line interface (CLI) is an industrial standard. CLI interpreter provides a list of commands and keywords that help the user and reduce the amount of input data.                                                                                                                                                                                                                                                                                                                      |
| <b>Syslog</b>                                           | <i>Syslog</i> is a protocol designed for transmission of system event messages and error notifications to remote servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>SNTP (Simple Network Time Protocol)</b>              | <i>SNTP</i> is a network time synchronization protocol used to synchronize time on a network device with the server with an accuracy to 1 millisecond.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Traceroute</b>                                       | <i>Traceroute</i> is a service feature that allows displaying data transfer routes in IP networks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Privilege level controlled access management</b>     | The administrator can define privilege levels for device users and settings for each privilege level (read-only - level 1, full access - level 15).                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Management interface blocking</b>                    | The switch can block access to each management interface (SNMP, CLI). Each type of access can be blocked independently: <ul style="list-style-type: none"> <li>• Telnet (CLI over Telnet Session);</li> <li>• SNMP;</li> <li>• SSH.</li> </ul>                                                                                                                                                                                                                                                                                                                                                  |
| <b>Local authentication</b>                             | Passwords for local authentication can be stored in the switch database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>IP address filtering for SNMP</b>                    | Access via SNMP is allowed only for specific IP addresses that belong to the SNMP community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>DHCP server features</b>                             | DHCP server performs centralized management of network addresses and corresponding configuration parameters, and automatically provides them to subscribers. <div style="display: flex; align-items: center;">  <p><b>The function is supported only for MES2424, MES2424B, MES2424FB, MES2424P, MES2410-08DP, MES2410-08DU, MES2420-48P, MES2420B-24D, MES2448, MES2448B, MES2448P, MES2411X, MES3400-24, MES3400-24F, MES3400-48, MES3400-48F, MES3710P models.</b></p> </div> |

|                                                                   |                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RADIUS client</b>                                              | RADIUS is used for authentication, authorization and accounting. RADIUS server uses a user database that contains authentication data for each user. The switches implement a RADIUS client.                                               |
| <b>TACACS+ (Terminal Access Controller Access Control System)</b> | The device supports client authentication with TACACS+ protocol. The TACACS+ protocol provides a centralized security system that handles user authentication and maintains compatibility with RADIUS and other authentication mechanisms. |

### 1.2.8 Additional features

Table 8 lists additional device features.

Table 8 — Additional features

|                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Virtual Cable Test (VCT)</b>               | The network switches are equipped with the hardware and software tools that allow them to perform virtual cable tester (VCT) functions. The tester checks the condition of copper communication cables.                                                                                                                                                                                                                                                                               |
| <b>Optical transceiver diagnostics</b>        | The device can be used to test the optical transceiver. During testing, parameters such as current, supply voltage and transceiver temperature are monitored. Implementation requires the transceiver to support these functions.                                                                                                                                                                                                                                                     |
| <b>UDLD (Unidirectional Link Detection)</b>   | Layer 2 protocol created to automatic detection of two-way communication loss on optical lines.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Compliance with the IEC 61850 standard</b> | The switch has all the necessary characteristics to work with the protocols MMS, GOOSE, SV: <ul style="list-style-type: none"> <li>• Low GOOSE message delay during transmission;</li> <li>• Ability to recognize Ethernet GOOSE messages;</li> <li>• Ability to handle virtual network tagging and IEEE 802.1Q GOOSE priority tagging;</li> <li>• Support for multicast message transmission and the ability to work with an IEC 61850 defined range of broadcast groups.</li> </ul> |

## 1.3 Main specifications

Table 9 shows main switch specifications.

Table 9 — Main specifications

| General parameters |                                                    |                                                                                                                            |

## 1.4 Design

This section describes the design of devices. It provides the images of front, rear (top for MES3710P) and side panels of the devices, the description of connectors, LED indicators and controls.

Ethernet switches MES14xx, MES24xx, MES34xx have a metal-enclosed design for 1U 19" racks.

Ethernet switch MES3708P is enclosed in metal housing with the ability to be mounted on a pole no thicker than 8mm. The enclosure protection class is IP55.

Ethernet switch MES3710P is enclosed in metal housing for DIN rail mounting.

### 1.4.1 Layout and description of the front panels

The front panel layout of the MES1428 series devices is shown in figures 1–2.

Figure 1 — MES1428 AC front panel

Figure 2 — MES1428 DC front panel

Table 10 lists connectors, LEDs and controls located on the front panel of the switch.

Table 10 — Description of MES1428 connectors, LEDs and front panel controls

| #   | Front panel element         | Description                    |
|-----|-----------------------------|--------------------------------|
| 1   | ~110-250VAC, 60/50Hz max 1A | Connector for AC power supply. |
| 1.1 | ~18-72VAC, max 1A           | Connector for DC power supply. |
| 2   | Power                       | Device power LED.              |

|   |                |                                                                                                                                                                                                                                                                                                                                                            |
|---|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Alarm          | Overheating LED.                                                                                                                                                                                                                                                                                                                                           |
| 3 | Console        | <p>Console port for local management of the device.</p> <p>Connector pinout:</p> <ul style="list-style-type: none"> <li>1 not used</li> <li>2 not used</li> <li>3 RX</li> <li>4 GND</li> <li>5 GND</li> <li>6 TX</li> <li>7 not used</li> <li>8 not used</li> <li>9 not used</li> </ul> <p>Console cable pinout is given in APPENDIX A. Console cable.</p> |
| 4 | F              | <p>Functional key that reboots the device and resets it to factory default configuration:</p> <ul style="list-style-type: none"> <li>- pressing the key for less than 10 seconds reboots the device;</li> <li>- pressing the key for more than 10 seconds resets the device to factory default configuration.</li> </ul>                                   |
| 5 | [1-24]         | 10/100BASE-TX (RJ-45) ports.                                                                                                                                                                                                                                                                                                                               |
| 6 | 25, 26, 27, 28 | Combo ports: 10/100/1000BASE-T (RJ-45).                                                                                                                                                                                                                                                                                                                    |
| 7 | 25, 26, 27, 28 | <p>Combo ports: slots for 1000BASE-X Combo transceivers installation.</p> <p>LNK/SPD – optical interface status LED.</p>                                                                                                                                                                                                                                   |

The front panel layout of the MES2408 series devices is shown in figures 3–11.

| 3 | 12VDC max 5A                                                                                            | Alarm relay output: 1 A 24 V DC.   |

### 1.4.3 Side panels of the device

Figure 50 — Right side panel of Ethernet switches

Figure 51 — Left side panel of Ethernet switches

Side panels of the device have air vents for heat removal. Do not block air vents. This may cause the components to overheat, which may result in device malfunction. Recommendations for installing the device are given in the section "Installation and connection".

#### 1.4.4 MES3708P switch design

The section describes the design of the MES3708P Ethernet switch.

The device consists of the main board, power supply board and 10/100/1000BASE-T Ethernet port overvoltage protection modules. The boards are housed in a metal case.

The case has a metal hook for mounting the device. Mounting on the pole no thicker than 8 mm. Power and network interfaces are wired to the connectors located inside the case. The wires are led out through special holes in the case.

Figure 52 shows the main components and connectors of MES3708P.

Figure 52 — Main components and connectors of MES3708P

Table below describes the main components and connectors of MES3708P.

Table 21 — Main components and connectors of MES3708P

| #  | Description                                                                    |
|----|--------------------------------------------------------------------------------|
| 1  | Slots for 100BASE-FX/1000BASE-X (SFP) transceivers installing.                 |
| 2  | Main board of the device.                                                      |
| 3  | Power supply unit board.                                                       |
| 4  | Connector for AC power supply.                                                 |
| 5  | Connectors for 10/100/1000BASE-T Ethernet port overvoltage protection modules. |
| 6  | 10/100/1000BASE-T Ethernet port overvoltage protection modules.                |
| 7  | Earth bonding point of the device.                                             |
| 8  | Connectors for local Ethernet network devices                                  |
| 9  | Power cable gland.                                                             |
| 10 | Gland for copper and fiber cables of local Ethernet network.                   |
| 11 | Connector for access to the device console via RS-232.                         |

### 1.4.5 Light indication

Ethernet interface status is represented by two LEDs: green *LINK/ACT* and amber *SPEED*. LEDs layout is shown in figures 53–55.

Figure 53 — Single SFP/SFP+ connector

Figure 54 — Dual SFP/SFP+ connector

Figure 55 — RJ-45 connector

Table 22 — Light indication of 10/100/1000BASE-T Ethernet ports

| SPEED indicator is lit | LINK/ACT indicator is lit | Ethernet interface state                           |
|------------------------|---------------------------|----------------------------------------------------|
| Off                    | Off                       | Port is disabled or connection is not established. |
| Off                    | Solid                     | 10 Mbps or 100 Mbps connection is established.     |
| Solid                  | Solid                     | 1000 Mbps connection is established.               |
| X                      | Flashing                  | Data transfer is in progress.                      |

Table 23 — Light indication of XG ports

| SPEED indicator is lit | LINK/ACT indicator is lit | Ethernet interface state                           |
|------------------------|---------------------------|----------------------------------------------------|
| Off                    | Off                       | Port is disabled or connection is not established. |
| Off                    | Solid                     | 1 Gbps connection is established.                  |
| Solid                  | Solid                     | 10 Gbps connection is established.                 |
| X                      | Flashing                  | Data transfer is in progress.                      |

System indicators (Power, Alarm) are designed to display the operational status of MES14xx, MES24xx, MES34xx switch nodes.

Table 24 — Light indication of system indicators

| LED name       | LED function                        | LED Status               | Device Status                                                                                                                   |
|----------------|-------------------------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>Power</i>   | Power supply status                 | Off                      | Power is off.                                                                                                                   |
|                |                                     | Solid green              | Power is on, normal device operation.                                                                                           |
|                |                                     | Flashing green           | Power-on self-test (POST).                                                                                                      |
|                |                                     | Solid red                | No primary power supply from the main source (when the device is powered from a backup source) or the secondary source failure. |
| <i>Alarm</i>   | State of the device                 | Off                      | Normal device operation.                                                                                                        |
|                |                                     | Solid red                | Failure of one or more fans.                                                                                                    |
| <i>PoE</i>     | PoE ports status LED                | Solid green              | PoE consumer is connected (the corresponding LED is on).                                                                        |
|                |                                     | Solid red                | Failure on the PoE port.                                                                                                        |
|                |                                     | Off                      | PoE consumer is not connected.                                                                                                  |
| <i>Master</i>  | Indicates master stack unit         | Off                      | Stacking mode is not supported.                                                                                                 |
| <i>Battery</i> | Battery status LED                  | Solid green <sup>1</sup> | Battery connected.                                                                                                              |
|                |                                     | Solid red                | Low battery.                                                                                                                    |
|                |                                     | Off <sup>1</sup>         | Battery disconnected.                                                                                                           |
| <i>RPS</i>     | Backup power supply operating mode. | Solid green              | Backup power supply is connected and operating normally.                                                                        |
|                |                                     | Solid red                | Backup power supply is missing or failed.                                                                                       |
|                |                                     | Off                      | Backup power supply is not connected.                                                                                           |
| <i>FAN</i>     | Fan operation LED.                  | Solid green              | The fans are operating normally.                                                                                                |
|                |                                     | Solid red                | The fan malfunction.                                                                                                            |

<sup>1</sup> When connecting the battery, the display changeover can be delayed up to 5 minutes

**If Alarm and PoE LEDs are solid red simultaneously, it means that there is a critical PoE error.**

## 1.5 Delivery package

The standard delivery package includes:

- Ethernet switch;
- Rack mounting kit (except MES3708P, MES3710P);
- C13, 1.8m power cord (only for MES2408C, MES2408CP, MES2408PL, MES2428B, MES2408B, MES2420B-24D, MES1428 AC, MES2408 AC, MES2428 AC, MES2428T AC, MES2408P AC, MES2428P AC, MES2410-08DP, MES2410-08DU, MES2424 AC, MES2424P, MES2424B, MES2424FB, MES2448B, MES2411X);
- PVC 2×1.5. 2m (only for MES2408IP DC1, MES1428 DC, MES2408 DC, MES2424B, MES2424FB, MES2428 DC, MES2428T DC, MES2408P DC, MES2428P DC, MES2424 DC, MES2448 DC, MES3710P);
- Pluggable terminal blocks (1 Pos. — 1 pc., 2 Pos. — 2 pcs.) (only for MES3710P)
- Technical passport.

On request, the delivery package can include:

- User manual on CD;
- Power supply module PM160-220/12 (for MES3400-24, MES3400I-24, MES3400-24F, MES3400-48, MES3400-48F) or PM380-220/56 (for MES2448P);
- C13 1.8m power cord (when equipped with PM160-220/12 or PM380-220/56 power module);
- Power supply module PM100-48/12 (for MES3400-24, MES3400I-24, MES3400-24F, MES3400-48, MES3400-48F);
- PVC 2×1.5, 2m power cord (when equipped with PM100-48/12 power module);
- Console cable;
- SFP/SFP+ transceivers.

## 2 INSTALLATION AND CONNECTION

**Equipment operation in a residential environment could cause radio interference.**

This section describes installation of the equipment into a rack and connection to a power supply.

### 2.1 Device rack installation

The delivery package includes support brackets for rack installation and mounting screws to fix the device case on the brackets. There are six mounting holes on the brackets for different mounting options, which allow adjusting the distance between the front panel and the door of the server rack (figures 56–57). To install the brackets, select one of the mounting options:

Figure 56 — Bracket mounting option 1

Figure 57 — Bracket mounting option 2

1. Select the desired bracket positions shown in the pictures above. Align four mounting holes in the support bracket with the corresponding holes in the side panel of the device. Use a screwdriver to screw the support bracket to the case.
2. Repeat step 1 for the second bracket.

3. Align the holes of the brackets with the holes on the front vertical rails of the rack (figure 58). Use the holes of the same level on both sides of the guides to ensure horizontal installation of the device. Use a screwdriver to attach the device to the rack with screws.

Figure 58 — Device rack mounting

Figure 59 shows an example of MES14xx, MES24xx and MES34xx rack installation.

Figure 59 — MES14xx, MES24xx and MES34xx rack installation

**Do not block air vents and fans located on the rear panel to avoid components overheating and subsequent switch malfunction.**

## 2.2 MES3710P DIN rail installation

**The MES3710P switch is installed vertically, as the side panels provide heat dissipation.**

To install the device on a DIN rail:

1. Tilt the device with the upper part away from you and place it on the DIN rail so that its upper edge is behind the wire spring.
2. Press down on the device housing from the top.
3. Without releasing the pressure, press the lower part of the device's housing against the DIN rail until it snaps into place.

To remove the device from the DIN rail:

1. Press down on the device housing from the top.
2. Without releasing the pressure, pull the lower part of the device towards you.
3. Lifting the housing, remove the device from the DIN rail.

## 2.3 Connection to power supply

1. Prior to connecting the power supply, the device case must be grounded. Use an insulated stranded wire to ground the case. The grounding device and the ground wire cross-section must comply with Electric Installation Code.

**Connection must be performed by a qualified specialist.**

2. If you intend to connect a PC or another device to the switch console port, the device must be properly grounded as well.
3. Connect the power supply cable to the device. Depending on the delivery package, the device can be powered by AC or DC electrical network. To connect the device to AC power supply, use the cable from the delivery package. To connect the device to DC power supply, use wires with a minimum cross-section of 1 mm<sup>2</sup>.

**In order to avoid short-circuits when connecting to the DC network, a 9 mm wire stripping is recommended.**

**The DC power supply circuit should contain a power-off device with physical separation of the connection (circuit breaker, connector, contactor, automatic switch, etc.).**

4. Turn the device on and check the front panel LEDs to make sure the terminal is operating normally.

**To connect MES3708P to the power supply, you need to remove the device cover by removing 18 screws located at the edges with a screwdriver.**

## 2.4 SFP transceiver installation and removal

Optical modules can be installed when the terminal is turned on or off.

It is recommended to perform separate connection of SFP transceiver and optical patch cord to the slot.

1. Insert the top SFP module into a slot with its open side down, and the bottom SFP module with its open side up.

Figure 60 — SFP transceiver installation

2. Push the module. When it takes the right position, you should hear a distinctive 'click'.

Figure 61 — Installed SFP transceivers

To remove a transceiver, perform the following actions:

1. Unlock the module's latch.

Figure 62 — Opening SFP transceiver latch

2. Remove the module from the slot.

Figure 63 — SFP transceiver removal

## 3 INITIAL SWITCH CONFIGURATION

### 3.1 Hotkeys

| Key Sequence | Description                            |
|--------------|----------------------------------------|
| Ctrl+A       | Go to beginning of line.               |
| Ctrl+E       | Go to end of line.                     |
| Ctrl+F       | Go forward one character.              |
| Ctrl+B       | Go backward one character.             |
| Ctrl+D       | Delete current character.              |
| Ctrl+U,X     | Delete to beginning of line.           |
| Ctrl+K       | Delete to end of line.                 |
| Ctrl+W       | Delete previous word.                  |
| Ctrl+T       | Transpose previous character.          |
| Ctrl+P       | Go to previous line in history buffer. |
| Ctrl+N       | Go to next line in history buffer.     |
| Ctrl+Z       | Return to root command prompt.         |

### 3.2 Terminal configuration

Run the terminal emulation application on PC (HyperTerminal, TeraTerm, Minicom) and perform the following actions:

- select the corresponding serial port;
- set the data transfer rate to 115,200 baud.
- specify the data format: 8 data bits, 1 stop bit, non-parity;
- disable hardware and software data flow control;
- specify VT100 terminal emulation mode (many terminal applications use this emulation mode by default).

### 3.3 Turning on the device

Establish connection between the switch console ('console' port) and the serial interface port on PC that runs the terminal emulation application.

Turn on the device. After each turning on the switch, the process of initialization is launched. You should authorize to operate with the switch:

```
ISS login:admin
Password:***** (admin)

console#
```

### 3.4 Startup menu

To enter the boot menu, connect to the device via RS-232 interface, reboot the device and enter the password for the boot menu within 3 seconds after the lines appear:

```
U-Boot 2011.12.(2.1.5.67086) (Feb 18 2019 - 06:43:17)

CPU:500MHz LXB:200MHz MEM:300MHz
DRAM: 256 MB
SPI-F: 1x32 MB
Loading 65536B env. variables from offset 0x110000
chip_index= 23
Switch Model: MES2428_board (Port Count: 28)
*****
Now External 8218B
*****
Now Internal PHY
*****
Now External 8218B
*****
Now External 8214FC
Net: Net Initialization Skipped
Autoboot in 3 seconds..
```

**Default password for the boot menu for all devices is 'eltex'.**

Startup menu view:

```
Startup Menu
[1] Restore Factory Defaults
[2] Boot password
[3] Password Recovery Procedure
[4] Image menu
[5] Serial bandwidth
Enter your choice or press 'ESC' to exit:
```

Table 25 — Boot menu interface functions

| <i><b>Function</b></i>             | <i><b>Description</b></i>                                                                                                                                                                                                                                                                                                                       |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Restore Factory Defaults</b>    | Restoring the factory default configuration.                                                                                                                                                                                                                                                                                                    |
| <b>Boot password</b>               | Changing the the boot menu password.                                                                                                                                                                                                                                                                                                            |
| <b>Password Pecovery Procedure</b> | Recovery of a lost password. The next time the main firmware is loaded, the user will immediately enter Privileged EXEC mode without entering a password.                                                                                                                                                                                       |
| <b>Image menu</b>                  | Select active firmware image. If the newly downloaded system software file is not selected as active, the device will download using the currently active image.<br>Image menu<br>[1] Show current image — view the active slot with the firmware image;<br>[2] Set current image — select the active slot of the system firmware;<br>[3] Back. |
| <b>Serial bandwidth</b>            | Selecting the speed of the serial interface.                                                                                                                                                                                                                                                                                                    |

To exit the boot menu and continue loading the main firmware image, press <Esc>.

**If none of the menu items is selected within 1 minute, the device will continue to boot.**

## 3.5 Switch function configuration

Initial configuration functions can be divided into two types:

- **Basic configuration** includes definition of basic configuration functions and dynamic IP address configuration.
- **Security system parameters configuration** includes security system management based on AAA mechanism (Authentication, Authorization, Accounting).

**All unsaved changes will be lost after the device is rebooted. Use the following command to save all changes made to the switch configuration:**

```
console# write startup-config
```

### 3.5.1 Automatic configuration of switch parameters (Zero Touch Provisioning)

In order to automate the management of the switch, the ZTP (Zero Touch Provisioning) function is supported on the device. This function allows configuring some options from the DHCP server at the device connection step. By default, ZTP is enabled automatically.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 26 — Global configuration mode commands

| Command     | Value/Default value                                      | Action                                                                                                                                                                                                                                                                                  |
|-------------|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ztp enable  | -/enabled, starts at the beginning of the firmware start | Enable the ZTP function.<br> <b>By default, ZTP supports transmission of options 43, 66, 67. Suboptions for option 43:</b><br>- 1 — image<br>- 2 — bootfile<br>- 3 — config-file<br>- 4 — tftpserver |
| ztp disable |                                                          | Disable the ZTP function.                                                                                                                                                                                                                                                               |

### 3.5.2 Basic switch configuration

Prior to configuration, connect the device to PC using the serial port. Run the terminal emulation application on the PC according to the 3.2 "Terminal configuration" section.

During initial configuration, you can define which interface will be used for remote connection to the device.

Basic configuration includes:

1. Setting the password for the user "admin" (with level 15 privileges).
2. Creating new users.
3. Configuring static IP address, subnet mask, default gateway.
4. Configuring SNMP settings.

### 3.5.2.1 Setting up the admin password and creating new users

Configure the password for the "admin" privileged user to ensure access to the system.

Username and password are required to log in for device administration. Use the following commands to create a new system user or configure the username, password, or privilege level:

```
console# configure terminal
console(config)# username name password password privilege {1-15}
```

Privilege levels from 1 to 14 allow access to the device, but deny its configuration. Privilege level 15 allows both the access and configuration of the device.

Example commands to set the "admin" user's password as "Eltex\_1" and create the "operator" user with the "Pass\_2" password and privilege level 1:

```
console# configure terminal
console(config)# username admin password Eltex_1
console(config)# username operator password Pass_2 privilege 1
console(config)# exit
console#
```

Information about local accounts is stored in non-volatile memory and can be cleared with the 'delete startup-config' command.

It is necessary to put account names and passwords containing special characters in quotation marks.

### 3.5.2.2 Configure static IP address, subnet mask, default gateway.

In order to manage the switch from the network, configure the device IP address, subnet mask, and, in case the device is managed from another network, default gateway. An IP address can be assigned to the VLAN interface (by default, the IP address 192.168.1.239 is assigned to the VLAN 1 interface, mask 255.255.255.0). Gateway IP address should belong to the same subnet as one of the device's IP interfaces.

The IP address 192.168.1.239 exists until another IP address is created statically or via DHCP on any interface. At the same time, the dhcp client must be enabled on interface vlan 1.

If all switch IP addresses are deleted, you can access it via IP 192.168.1.239/24. At the same time, the dhcp client must be enabled on interface vlan 1.

#### Command examples for IP address configuration on VLAN 1 interface.

Interface parameters:

*The IP address assigned to the VLAN 1 interface is 192.168.16.144*

*Subnet mask – 255.255.255.0*

*The default gateway IP address: 192.168.1.1*

```
console# configure terminal
console(config)# interface vlan 1
console(config-if)# ip address 192.168.16.144 255.255.255.0
console(config-if)# exit
console(config)# ip route 0.0.0.0 0.0.0.0 192.168.1.1
```

To verify that the interface was assigned the correct IP address, enter the following command:

```
console# show ip interface
```

```
vlan1 is up, line protocol is up
Internet Address is 192.168.16.144/24
Broadcast Address 192.168.16.255
Vlan counters disabled
```

### 3.5.2.3 Configuring SNMP settings for accessing the device

Switches allow configuring SNMP for device remote monitoring and management. The device supports SNMPv1, SNMPv2 and SNMPv3.

To enable device administration via SNMP, you have to create at least one community string.

We will use the snmpv2c version as an example. Let's create a user belonging to the GROUP group. This user should be able to use community NETMAN, which will be assigned the index 1. The GROUP group will be allowed to read/write/receive snmp-traps for objects belonging to viewiso. Objects that are allowed to send traps must belong to the TAG list and be sent to the ADDR address group, which includes the IP address 192.168.1.1. The sending parameters are specified in targetparam TRAPS, defined for the USER user.

```
console(config)#snmp user USER
console(config)#snmp community index 1 name NETMAN security USER
console(config)#snmp group GROUP user USER security-model v2c
console(config)#snmp access GROUP v2c read iso write iso notify iso
console(config)#snmp view iso 1 included
console(config)#snmp targetaddr ADDR param TRAPS 192.168.1.1 taglist TAG
console(config)#snmp targetparams TRAPS user USER security-model v2c
message-processing v2c
console(config)#snmp notify USER tag TAG type Trap
```

### 3.5.3 Security system configuration

To ensure system security, the switch uses AAA mechanism (Authentication, Authorization, Accounting). The *SSH mechanism* is used for data encryption.

- *Authentication* — matching the request to an existing account in the security system.
- *Authorization* (access level verification) — matching an existing (authenticated) account in the system to specific privileges.
- *Accounting* — user resource consumption monitoring.

When using the default device settings, the user name is **admin**, the password is **admin**.

The default user (admin/admin) exists until any other user with privilege level 15 is created.

There must always be a user with privilege level 15.

### 3.5.3.1 Configuring access to RADIUS and TACACS+ servers

To use Radius and TACACS+ servers, perform the following settings on the switch:

- Configure the IP address of the server;
- Configure the access key specified for the configured server (if available).

#### Example of commands for configuring RADIUS and TACACS+ servers:

```
console# configure terminal  
console(config)# radius-server host 192.168.16.3 key KEY  
console(config)# tacacs-server host 192.168.16.3 key KEY
```

### 3.5.3.2 Configuring AAA for different management protocols

Set up the default AAA list. The default AAA list is applied to all lines (console, telnet, SSH), unless otherwise specified for the specified line. In the example above, the console line will be accessed only via a local database.

#### Example of commands for AAA configuration:

```
console(config)# aaa authentication default radius tacacs local  
console(config)# aaa authentication user-defined cons local  
console(config)# line console  
console(config-line)# aaa authentication login cons  
console(config-line)# aaa authentication enable cons
```

## 4 DEVICE MANAGEMENT. COMMAND LINE INTERFACE

Several modes are used to configure the switch settings. Each mode has its own specific set of commands. Enter the «?» character to view the set of commands available for each mode.

Switching between modes is performed by using special commands. The list of existing modes and commands for mode switching:

**Command mode (EXEC)** is available immediately after successfully booting the switch, entering the user name and password (for unprivileged users). System prompt in this mode consists of the device name (host name) and the '>' character.

```
console>
```

**Privileged command mode (privileged EXEC)** is available immediately after successfully booting the switch, entering the user name and password. System prompt in this mode consists of the device name (host name) and the '#' character.

```
console#
```

**Global configuration mode** allows specifying general settings of the switch. Global configuration mode commands are available in any configuration submode. The mode is entered by the **configure terminal** command.

```
console# configure terminal
console(config)#
```

**Terminal configuration mode (line configuration) mode** is intended for configuration related to the operation of the terminal. The mode is entered from the global configuration mode using the **line console** command.

```
console(config)# line console
console(config-line)#
```

### 4.1 Basic commands

#### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console>
```

Table 27 — Basic commands available in the EXEC mode

| Command               | Value/Default value | Action                                                                                  |
|-----------------------|---------------------|-----------------------------------------------------------------------------------------|
| <b>enable</b> [priv]  | priv: (1..15)/15    | Switch to the privileged mode (if the value is not defined, the privilege level is 15). |
| <b>logout</b>         | -                   | Close the current session and switch the user.                                          |
| <b>exit</b>           | -                   | Close the active terminal session.                                                      |
| <b>help</b>           | -                   | Get help on command line interface operations.                                          |
| <b>show privilege</b> | -                   | Show the privilege level of the current user.                                           |

### Privileged EXEC mode commands

Command line prompt is as follows:

```
console#
```

Table 28 — Basic commands available in the Privileged EXEC mode

| <b>Command</b>            | <b>Value/Default value</b> | <b>Action</b>                                      |
|---------------------------|----------------------------|----------------------------------------------------|
| <b>disable</b> [priv]     | priv: (1, 7, 15)/1         | Return to the normal mode from the privileged one. |
| <b>configure terminal</b> | -                          | Enter the configuration mode.                      |

### The commands available in all configuration modes

Command line prompt is as follows:

```
console#
console(config)#
console(config-line)#
```

Table 29 — Basic commands available in all configuration modes

| <b>Command</b> | <b>Value/Default value</b> | <b>Action</b>                                                                |
|----------------|----------------------------|------------------------------------------------------------------------------|
| <b>exit</b>    | -                          | Exit any configuration mode to the upper level in the CLI command hierarchy. |
| <b>end</b>     | -                          | Exit any configuration mode to the command mode (Privileged EXEC).           |
| <b>do</b>      | -                          | Execute a command of the command level (EXEC) from any configuration mode.   |
| <b>help</b>    | -                          | Show help on available commands.                                             |

## 4.2 Filtering command line messages

Message filtering allows reducing the amount of data displayed in response to user requests and facilitating the search for necessary information. To filter information, add '|' to the end of the command line and use one of the filtering options listed in the table 30. Filtering only for show-commands.

### Privileged EXEC mode commands

Command line prompt is as follows:

```
console#
```

Table 30 — Basic commands available in the Privileged EXEC mode

| <b>Command</b>          | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>grep</b>             | -                          | Print all lines containing the template.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>grep -v</b>          | -                          | Print all lines that do not contain a template.                                                                                                                                                                                                                                                                                                                                                          |
| <b>grep -c "regexp"</b> | -                          | Print all lines containing regular expressions:<br>. — matches any single character;<br>* — the previous character corresponds to 0 or more times;<br>^ — corresponds to a space at the beginning of the line;<br>\b — corresponds to a space at the end of a word;<br>[] — outputs all lines containing characters from square brackets;<br>\ — ignores the character following the regular expression. |

## 4.3 Configuring macro commands

This function allows creating unified sets of commands — macros that can be used later in the configuration process. The maximum number of macros is 15.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 31 — Global configuration mode commands

| <b>Command</b>                                                                   | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>macro name word</b>                                                           | word: (1..32) characters   | Create a new set of commands, if a set with the same name exists, overwrite it. The command set is entered line by line. To finish the macro, enter the "@" character. Maximum macro length is 510 characters. In macro body you can use up to three variables in the configuration. |
| <b>no macro name word</b>                                                        |                            | Delete the specified macro.                                                                                                                                                                                                                                                          |
| <b>macro apply word</b><br>[pattern1 value1] [pattern2 value2] [pattern3 value3] | word: (1..32) characters   | Apply the specified macro.<br>- <i>pattern</i> — a pattern consisting of a declaration, for example, the symbol "%", and a variable written together;<br>- <i>value</i> — a configuration variable.                                                                                  |
| <b>macro trace word</b><br>[pattern1 value1] [pattern2 value2] [pattern3 value3] | word: (1..32) characters   | Display the macro execution process.<br>- <i>pattern</i> — a pattern consisting of a declaration, for example, the symbol "%", and a variable written together;<br>- <i>value</i> — a configuration variable.                                                                        |

### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 32 — EXEC mode commands

| <b>Command</b>                                                                   | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>macro apply word</b><br>[pattern1 value1] [pattern2 value2] [pattern3 value3] | word: (1..32) characters   | Apply the specified macro.<br>- <i>pattern</i> — a pattern consisting of a declaration, for example, the symbol "%", and a variable written together;<br>- <i>value</i> — a configuration variable.           |
| <b>macro trace word</b><br>[pattern1 value1] [pattern2 value2] [pattern3 value3] | word: (1..32) characters   | Display the macro execution process.<br>- <i>pattern</i> — a pattern consisting of a declaration, for example, the symbol "%", and a variable written together;<br>- <i>value</i> — a configuration variable. |
| <b>show macro</b>                                                                | -                          | Display the parameters of the configured macros on the device.                                                                                                                                                |

### Interface configuration mode commands

Command line prompt in the interface configuration mode is as follows:

```
console(config-if)#
```

Table 33 — Interface configuration mode commands

| Command                                                                          | Value/Default value      | Action                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>macro apply word</b><br>[pattern1 value1] [pattern2 value2] [pattern3 value3] | word: (1..32) characters | Apply the specified macro.<br>- <i>pattern</i> — a pattern consisting of a declaration, for example, the symbol "%", and a variable written together;<br>- <i>value</i> — a configuration variable.           |
| <b>macro trace word</b><br>[pattern1 value1] [pattern2 value2] [pattern3 value3] | word: (1..32) characters | Display the macro execution process.<br>- <i>pattern</i> — a pattern consisting of a declaration, for example, the symbol "%", and a variable written together;<br>- <i>value</i> — a configuration variable. |

### Example of using macros:

```

console(config)#macro name 1234
Enter macro commands, one per line. End with symbol '@'.
conf t
interface gi0/%1
switchport mode access
switchport access vlan %2
description %3
@
console#macro apply 1234 %1 6 %2 10 %3 "gi0/6"

```

## 4.4 System management commands

### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console>
```

Table 34 — Commands for managing the system in the EXEC mode

| Command                                                                                                 | Value/Default value                                                                                                       | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ping</b> {A.B.C.D   host   ipv6 AAAA::BBBB} [size size] [count count] [timeout timeout]              | host: (1..158) characters;<br>size: (36..2080)/64 bytes;<br>count: (0..10)/3;<br>timeout: (1..100)                        | This command is used to transmit ICMP requests (ICMP Echo-Request) to a specific network node and to manage replies (ICMP Echo-Reply).<br>- A.B.C.D — network node IPv4 address;<br>- AAAA::BBBB — network node IPv6 address;<br>- host — network node domain name;<br>- size — size of the packet to be sent, the number of bytes in the packet;<br>- count — the number of packets to be sent;<br>- timeout — request timeout.                                                                                                                                                              |

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 35 — Commands for managing the system in Privileged EXEC mode

| <b>Command</b>                        | <b>Value/Default value</b>                                                       | <b>Action</b>                                        |
|---------------------------------------|----------------------------------------------------------------------------------|------------------------------------------------------|
| <b>reload</b>                         | -                                                                                | The command is used to restart the device.           |
| <b>reload at hh:mm:ss [day month]</b> | hh: (0..23);<br>mm: (0..59);<br>ss: (0..59);<br>day: (1...31);<br>month: (1..12) | Setting the device restart time.                     |
| <b>reload in {hours minutes}</b>      | hours: (0..168);<br>minutes: (0..59)                                             | Setting the time after which the device will reload. |
| <b>reload cancel</b>                  | -                                                                                | Canceling a delayed reboot.                          |
| <b>show reload</b>                    | -                                                                                | View the time for which the reload is scheduled.     |

The errors that may occur during execution of the *traceroute* command are described in table 36.

Table 36 — Errors when executing the *traceroute* command

| <b>Error symbol</b> | <b>Description</b>                                                                                                              |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------|
| *                   | Packet transmission timeout.                                                                                                    |
| ?                   | Unknown packet type.                                                                                                            |
| A                   | Administratively unavailable. As a rule, this error occurs when the egress traffic is blocked by rules in the ACL access table. |
| F                   | Fragmentation or DF bit is required.                                                                                            |
| H                   | Network node is not available.                                                                                                  |
| N                   | Network is not available.                                                                                                       |
| P                   | Protocol is not available.                                                                                                      |
| Q                   | Source is suppressed.                                                                                                           |
| R                   | Expiration of the fragment reassembly timer.                                                                                    |
| S                   | Egress route error.                                                                                                             |
| U                   | Port is unavailable.                                                                                                            |

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 37 — System management commands in the global configuration mode

| <b>Command</b>              | <b>Value/Default value</b>  | <b>Action</b>                                              |
|-----------------------------|-----------------------------|------------------------------------------------------------|
| <b>hostname name</b>        | name: (1..128) characters/- | The command is used to set the network name of the device. |
| <b>no hostname</b>          |                             | Set the default network device name.                       |
| <b>system location name</b> | name:(1..255) characters    | Specify the device location information.                   |

|                                                                            |                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>system contact</b> <i>name</i>                                          | name:(1..255)<br>characters       | Specify the contact information of the device.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>system description</b> <i>name</i>                                      | name:(1..255)<br>characters       | Set a description of the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>cpu rate limit queue</b> <i>queue</i><br><b>maxrate</b> <i>pps</i>      | queue: (1-8)<br>-pps: 1..2000/128 | Set an incoming frame rate limit for a specific queue<br>- <i>pps</i> — packets per second.<br><br> <b>Implements the CoPP (Control plane protection) function.</b><br><br> <b>The distribution of queues for received traffic on the CPU is given in Appendix B. Queues for traffic received on the CPU.</b> |
| <b>cpu-rate limit queue</b> <i>queue</i><br><b>maxrate</b> 128             |                                   | Restore the default <i>pps</i> value for a specific queue.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>reset-button</b> { <i>enable</i>   <i>disable</i>   <i>reset-only</i> } | -/enable                          | - <i>enable</i> — when pressing the button F for less than 10 sec, the device reboots; when pressing the button for more than 10 sec, the device resets to factory settings;<br>- <i>disable</i> — the F button is disabled (does not respond to pressing);<br>- <i>reset-only</i> — reboot only.                                                                                                                                                                               |
| <b>set telnet-client enable</b>                                            | -/enabled                         | Enable the operation of the TELNET client.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>set telnet-client disable</b>                                           |                                   | Disable the operation of the TELNET client.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>set ip http enable</b>                                                  | -/enabled                         | Enable the HTTP server on the device.                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                                 |           |                                                                                                                       |
|---------------------------------|-----------|-----------------------------------------------------------------------------------------------------------------------|
| <b>no banner login</b>          |           | Delete a greeting for authorized users.                                                                               |
| <b>logging events reload</b>    | -/enabled | Enable the sending of snmp traps and syslog messages when the device is rebooted by the "reload" command or via SNMP. |
| <b>no logging events reload</b> |           | Disable sending snmp traps and syslog messages when restarting the device using the "reload" command or via SNMP.     |
| <b>ip http secure server</b>    | -/off     | Enable the HTTPS server on the device.                                                                                |
| <b>no ip http secure server</b> |           | Disable the HTTPS server on the device.                                                                               |

Table 38 — Privileged EXEC mode commands

| <b>Command</b>                       | <b>Value/Default value</b> | <b>Action</b>                                           |
|--------------------------------------|----------------------------|---------------------------------------------------------|
| <b>clear cpu rate limit counters</b> | -                          | Clear the rate limit counters on the CPU.               |
| <b>show cpu rate limit</b>           | -                          | Display the rate limit counters on the CPU.             |
| <b>set cli pagination on</b>         | -/on                       | Enable page-by-page configuration output.               |
| <b>set cli pagination off</b>        |                            | Disable page-by-page configuration output.              |
| <b>set cli prompt on</b>             | -/on                       | Enable confirmation before executing certain commands.  |
| <b>set cli prompt off</b>            |                            | Disable confirmation before executing certain commands. |

## 4.5 Password parameters configuration commands

This section is intended for setting up passwords for users.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config) #
```

Table 39 — System management commands in the global configuration mode

| <b>Command</b>                                                               | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------------------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>password validate char</b><br>[lowercase   numbers   symbols   uppercase] | -/off                      | Enable the password verification mechanism.<br>- lowercase — the password must contain lowercase characters;<br>- numbers — the password must contain at least one digit;<br>- symbols — the password must contain at least one character;<br>- uppercase — the password must contain uppercase characters. |
| <b>no password validate</b>                                                  |                            | Disable the password verification mechanism.                                                                                                                                                                                                                                                                |
| <b>password validate length</b><br>length                                    | length: (0..20)/0          | Set the minimum password length.                                                                                                                                                                                                                                                                            |
| <b>no password validate</b>                                                  |                            | Set the default value.                                                                                                                                                                                                                                                                                      |

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 40 — File operation commands in the Privileged EXEC mode

| <b>Command</b>                      | <b>Value/Default value</b> | <b>Action</b>                                              |
|-------------------------------------|----------------------------|------------------------------------------------------------|
| <b>show password validate rules</b> | -                          | View the current password verification mechanism settings. |

## 4.6 File operations

### 4.6.1 Command parameters description

When performing operations on files, the command arguments are URL addresses. The description of the keywords used in the operations is given in table 41.

Table 41 — Keywords and their description

| <b>Keyword</b>        | <b>Description</b>                                                                                                                                                                                                                    |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>flash://</b>       | Source or destination address for non-volatile memory. Non-volatile memory is used by default if the URL address is defined without the prefix (prefixes include: flash:, tftp:, scp:...).                                            |
| <b>running-config</b> | Current configuration file.                                                                                                                                                                                                           |
| <b>startup-config</b> | Initial configuration file.                                                                                                                                                                                                           |
| <b>active-image</b>   | Active image file.                                                                                                                                                                                                                    |
| <b>inactive-image</b> | Inactive image file.                                                                                                                                                                                                                  |
| <b>tftp://</b>        | Source or destination address for the TFTP server.<br>Syntax: <b>tftp://host/[directory]/ filename</b> .<br>- <b>host</b> — IPv4 address or device network name;<br>- <b>directory</b> — directory;<br>- <b>filename</b> — file name. |
| <b>usb://</b>         | Source or destination address for the USB drive.<br>Syntax: <b>usb://[directory]/ filename</b> .<br>- <b>directory</b> — directory;<br>- <b>filename</b> — file name.                                                                 |
| <b>logging</b>        | Command history file.                                                                                                                                                                                                                 |

#### 4.6.2 File operation commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 42 — File operation commands in the Privileged EXEC mode

| <b>Command</b>                                                                                                                                                                                                                                                                                   | <b>Value/Default value</b>                                                                                                                                  | <b>Action</b>                                                                                                                                                                                                                                                                                                                             |

|                                                      |   |                                                                    |
|------------------------------------------------------|---|--------------------------------------------------------------------|
| <b>write</b> { <i>startup-config</i>   <i>url</i> }  | - | Save the current configuration to the original configuration file. |
| <b>replace running-config</b><br><b>[flash:path]</b> | - | Replace running-config with the configuration from the file.       |
| <b>clear running-config</b>                          | - | Clear the current configuration (running-config).                  |
| <b>diff</b> [flash:path] [flash:path]                | - | Compare two configurations.                                        |

**The TFTP server cannot be the source address and destination address for the same copy command.**

Viewing an active and inactive image is available from u-boot. To do this, at the u-boot command prompt, enter:

```
MES2428# bootimg print
```

Command to change the active image from u-boot:

```
MES2428# bootimg inactive
```

**The "bootimg inactive" command is applied without waiting for confirmation.**

**When downloading a configuration file from a remote server, add a line with the symbol "!" to the "startup-config" at the beginning of the file.  
The configuration file must have the ".conf" extension.**

### 4.6.3 Configuration backup commands

This section describes the commands that allow you to back up the configuration to the server. To reserve the configuration, specify the server address.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 43 — Global configuration mode commands

| <b>Command</b>                       | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                   |
|--------------------------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>backup server</b> <i>dest_url</i> | -                          | Specify server that will be used for configuration backup. The string format is «tftp://XXX.XXX.XXX.XXX».                                                                       |
| <b>no backup server</b>              |                            | Delete the server address.                                                                                                                                                      |
| <b>backup path</b> <i>path</i>       | -                          | Specify the file location path on the server with the file name prefix. When saving, the current date and time will be added to the prefix in the <i>yyyymmddhhmmss</i> format. |

|                                 |                                        |                                                                               |
|---------------------------------|----------------------------------------|-------------------------------------------------------------------------------|
| <b>no backup path</b>           |                                        | Delete the backup path.                                                       |
| <b>backup auto</b>              | -                                      | Enable automatic configuration backup.                                        |
| <b>no backup auto</b>           |                                        | Disable automatic configuration backup.                                       |
| <b>backup history enable</b>    | -                                      | Enable backup history saving.                                                 |
| <b>no backup history enable</b> |                                        | Disable backup history saving.                                                |
| <b>backup time-period timer</b> | timer:<br>(1..35791394)/720<br>minutes | Specify the time period for automatic creation of the configuration backup.   |
| <b>no backup time-period</b>    |                                        | Set the default value.                                                        |
| <b>backup write-memory</b>      | -/off                                  | Enable configuration backup when a user saves configuration to flash storage. |
| <b>no backup write-memory</b>   |                                        | Set the default value.                                                        |

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 44 — Privileged EXEC mode commands

| <b>Command</b>               | <b>Value/Default value</b> | <b>Action</b>                                |
|------------------------------|----------------------------|----------------------------------------------|
| <b>backup running-config</b> | -                          | Create a configuration backup on the server. |

## 4.7 System time configuration

By default, automatic switching to daylight saving time is performed according to US and European standards. Any date and time for daylight saving time and back can be set in the configuration.

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 45 — Commands for setting the system time in the Privileged EXEC mode

| <b>Command</b>                           | <b>Value/Default value</b>                                                                                | <b>Action</b>                                                                                                                                                                                                        |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>clock set hh:mm:ss day month year</b> | hh: (0..23);<br>mm: (0..59);<br>ss: (0..59);<br>day: (1..31);<br>month: (Jan..Dec);<br>year: (2000..2037) | Manual system time setting (this command is available for privileged users only).<br>- <i>hh</i> – hours, <i>mm</i> – minutes, <i>ss</i> – seconds;<br>- <i>day</i> – day; <i>month</i> – month; <i>year</i> – year. |

### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 46 — Privileged EXEC mode commands

| <b>Command</b>               | <b>Value/Default value</b> | <b>Action</b>                  |
|------------------------------|----------------------------|--------------------------------|
| <b>show clock</b>            | -                          | Show the system time and date. |
| <b>show clock properties</b> | -                          | Display properties.            |

## Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console (config) #
```

Table 47 — List of system time configuration commands in the global configuration mode

| <b>Command</b>                      | <b>Value/Default value</b> | <b>Action</b>                                                          |
|-------------------------------------|----------------------------|------------------------------------------------------------------------|
| <b>clock time source</b> <i>ntp</i> | utc: (+00:00..+14:00)      | Set the SNTP server as the time synchronization source for the device. |
| <b>no clock time source</b>         |                            | Set the default value.                                                 |
| <b>clock utc-offset</b> <i>utc</i>  |                            | Set the hourly offset relative to the prime meridian.                  |
| <b>no clock utc-offset</b>          |                            | Set the default value.                                                 |

## SNTP configuration mode commands

To switch to the SNTP configuration mode, use the command:

```
console (config) #sntp
```

Command line prompt in the interface configuration mode is as follows:

```
console (config-sntp) #
```

Table 48 — List of system time configuration commands in the SNTP configuration mode

| <b>Command</b>                                                                                                    | <b>Value/Default value</b>                                                                                               | <b>Action</b>                                            |
|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>set sntp unicast-server auto-discovery enabled</b>                                                             | -/disabled                                                                                                               | Enable automatic SNTP server search in the unicast mode. |
| <b>set sntp unicast-server auto-discovery disabled</b>                                                            |                                                                                                                          | Disable automatic SNTP server search in unicast mode.    |
| <b>set sntp unicast-server {ipv4   ipv6   host} ip_addr [priority priority] [version version] [port udp_port]</b> | Up to 4 servers can be set<br>priority: (1..15);<br>port: (1025..36564);<br>version: (3..4);<br>host: (1..63) characters | Specify the IP address of the SNTP server.               |
| <b>no sntp unicast-server {ipv4   ipv6} ip_addr</b>                                                               |                                                                                                                          | Delete the IP address of the SNTP server.                |
| <b>set sntp client enable</b>                                                                                     | -/disabled                                                                                                               | Enable the operation of the SNTP client.                 |
| <b>set sntp client disable</b>                                                                                    |                                                                                                                          | Disable the operation of the SNTP client.                |
| <b>set sntp client addressing-mode unicast</b>                                                                    | -/unicast                                                                                                                | Specify the operating mode of the SNTP client.           |
| <b>set sntp client authentication-key key md5 params</b>                                                          | key: (0..65535)                                                                                                          | Set the authentication key for the SNTP client.          |
| <b>set sntp client clock-format {ampm   hours}</b>                                                                | -/hours                                                                                                                  | Set the clock format for SNTP.                           |
| <b>set sntp client port port_num</b>                                                                              | port_num: (123, 1025-65535)                                                                                              | Set the UDP port for the SNTP client.                    |
| <b>set sntp client time-zone zone</b>                                                                             | zone: (+00:00 to +14:00)                                                                                                 | Set the time zone value.                                 |
| <b>set sntp client version version</b>                                                                            | version: (v1,,v4)                                                                                                        | Set the protocol version for the SNTP client.            |

Table 49 — Privileged EXEC mode commands

| <b>Command</b>              | <b>Value/Default value</b> | <b>Action</b>                  |
|-----------------------------|----------------------------|--------------------------------|
| <b>show sntp statistics</b> | -                          | Show SNTP protocol statistics. |
| <b>show sntp status</b>     | -                          | Show SNTP protocol status.     |

## Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

### Example of configuring an SNTP client for the 192.168.1.1 server:

```
console(config)# sntp
console(config-sntp)# set sntp client enabled
console(config-sntp)# set sntp client addressing-mode unicast
console(config-sntp)# set sntp unicast-server ipv4 192.168.1.1
console(config-sntp)# exit
console(config)# clock time source ntp
```

## 4.8 Interfaces and VLAN configuration

### 4.8.1 Ethernet, Port-Channel and Loopback interface parameters

#### Interface configuration mode commands (interface range)

```
console# configure terminal
console(config)# interface { fastethernet fa_port | gigabitethernet
gi_port | twopointfivegigabitethernet two_port | tengigabitethernet
te_port | port-channel group | range {...} | loopback loopback_id }
console(config-if)#
```

This mode is available from the configuration mode and designed for configuration of interface parameters (switch port or port group operating in the load distribution mode) or the interface range parameters.

The interface is selected using the commands given in the Table 50:

Table 50 — Interface selection commands for MES14xx, MES24xx, MES37xx

| Command                                                      | Purpose                                    |
|--------------------------------------------------------------|--------------------------------------------|
| <b>interface</b> fastethernet <i>fa_port</i>                 | Configuration of Fast Ethernet interfaces. |
| <b>interface</b> gigabitethernet <i>gi_port</i>              | Configuration of 1G interfaces.            |
| <b>interface</b> twopointfivegigabitethernet <i>two_port</i> | Configuration of 2.5G interfaces.          |
| <b>Interface</b> tengigabitethernet <i>te_port</i>           | Configuration of 10G interfaces.           |
| <b>interface</b> port-channel <i>group</i>                   | Configuration of channel groups.           |
| <b>interface</b> loopback <i>loopback_id</i>                 | Configuration of virtual interfaces.       |

where:

- **fa\_port** is the serial number of the 100MB interface, set as: 0/1;
- **gi\_port** is the serial number of the 1G interface, set as: 0/1;
- **two\_port** is the serial number of the 2.5G interface, set as: 0/1;
- **te\_port** is the serial number of the 10G interface, set as 0/1;
- **group** is the serial number of the group, the total number according to the Table 9 ("LAG" row);
- **loopback\_id** is the serial number of the virtual interface, the total number according to the Table 9 ("Virtual Loopback interfaces" row).

The commands entered in the interface configuration mode are applied to the selected interface.

Table 51 — Ethernet and Port-Channel interface configuration mode commands

| Command            | Value/Default value | Action                                                  |
|--------------------|---------------------|---------------------------------------------------------|
| <b>shutdown</b>    | -/enabled           | Disable the current interface (Ethernet, port-channel). |
| <b>no shutdown</b> |                     | Enable the current interface.                           |

|                                                                                      |                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>map protocol</b> { <i>ip</i>   <i>other</i> }<br>{ <i>enet-v2</i>   <i>llcOther</i>   <i>snap</i> } <b>pro-</b><br><b>ocols-group</b> <i>group-id</i> | <i>group-id</i> :<br>(1..2147483647)/- | Set up a group of protocols according to which the classification of frames will be performed. You can combine several protocols into one group by specifying the same Group ID for them. The protocol number can be selected from the list of preset values or set manually via the other parameter in the XX:XX format. The location of the protocol number field depends on the type of L2 header and encapsulation:<br>- <b>enet-v2</b> is a frame with an Ethernet II header, the protocol is determined by the EtherType field. If there are VLAN tags, the most recent EtherType with the largest offset is selected.<br>- <b>llcOther</b> is an RFC1042 (IEEE 802) frame. The two-byte protocol number corresponds to the DSAP:SSAP fields in the LLC header.<br>- <b>snap</b> is a frame with LLC/SNAP encapsulation. The protocol number corresponds to the Protocol ID field in the SNAP header. |

### VLAN configuration mode commands (range of VLANs)

```
console# configure terminal
console(config)# vlan 1,3,7
console(config-vlan-range)#
```

Table 55 — VLAN configuration mode commands

| <b>Command</b>                                        | <b>Value/Default value</b> | <b>Action</b>                                  |
|-------------------------------------------------------|----------------------------|------------------------------------------------|
| <b>vlan active</b>                                    | —                          | Activate a vlan or a group of vlans.           |
| <b>set unicast-mac learning</b><br>{enable   disable} | —                          | Enable/disable MAC address learning for VLANs. |
| <b>set unicast-mac learning</b><br>default            |                            | Set the default value.                         |

### Ethernet or port group interface (interface range) configuration mode commands

Command line prompt in the Ethernet or port group interface configuration mode is as follows:

```
console# configure terminal
console(config)# interface { fastethernet fa_port | gigabitethernet
gi_port | twopointfivegigabitethernet two_port | tengigabitethernet
te_port | port-channel group}
console(config-if)#
```

This mode is available in the configuration mode and is designed for setting interface configuration parameters.

The port can operate in four modes:

- **access** — an untagged access interface for one VLAN;
- **trunk** — an interface accepting tagged traffic only, except for a single VLAN that can be added by the **switchport trunk native vlan** command;
- **general** — an interface with full 802.1q support, accepts both tagged and untagged traffic;

Table 56 — Ethernet interface configuration mode commands

| <b>Command</b>                                                                   | <b>Value/Default value</b>                | <b>Action</b>                                                                                                                                                                                            |

| <b>switchport egress-filter</b>                            | -/enabled          | Enables filtering of egress frames based on the VLAN ID value assigned to them. If filtering is enabled, and the packet is not included in the group of allowed VLAN IDs on the interface, the packet is discarded. |
| <b>no switchport egress-filter</b>                         |                    | Disable filtering of outgoing frames based on the VLAN ID value assigned to them.                                                                                                                                   |
| <b>switchport egress TPID-type {portbased   vlanbased}</b> | -                  | Set the TPID for outgoing frames.                                                                                                                                                                                   |
| <b>switchport voice vlan [vlan_id]</b>                     | vlan_id: (1..4094) | Enable Voice VLAN for the port.<br>- <i>vlan_id</i> — set the VLAN ID for the port.                                                                                                                                 |
| <b>no switchport voice vlan</b>                            |                    | Disable Voice VLAN for the port.                                                                                                                                                                                    |
| <b>voice vlan authentication bypass</b>                    | -/off              | Allow Voice VLAN traffic to ignore 802.1x authentication.                                                                                                                                                           |
| <b>no voice vlan authentication bypass</b>                 |                    | Prevent Voice VLAN traffic from ignoring 802.1x authentication.                                                                                                                                                     |

**When port-isolation and port-protected work together, the rule must be observed: for a protected ingress port, there cannot be another protected port in the list of allowed port-isolation commands. This implies the ability to secure isolated egress ports or an ingress port, but not ingress and egress ports at the same time.**

Example of a Q-in-Q setup with the addition of a 99 VLAN tag:

```
console#configure terminal
console(config)# interface gi 0/1
console(config-if)# switchport mode access
console(config-if)# switchport access vlan 99
console(config-if)# switchport dot1q tunnel
console(config)# interface gi 0/2
console(config-if)# switchport mode trunk
```

**The client port for Q-in-Q operation must be in access mode.**

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 57 — Global configuration mode commands

| Command                                                                                                                                                                                                                                                                                                                                                                                           | Value/Default value                                                                                            | Action                                                                                                                                                                                                                                                                                                               |

| <b>show protocol-vlan</b>                                                                                                                                                                                                                                   | -                                                                                                                                                                                | Show information about VLANs corresponding to protocol groups on different ports. |

## EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 59 — EXEC mode commands

| <b>Command</b>                                                                                                                                                                                           | <b>Value/Default value</b>                                                                                              | <b>Action</b>                          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| <b>show interfaces switchport {<br/>fastethernet <i>fa_port</i>  <br/>gigabitethernet <i>gi_port</i>  <br/>twopointfivegigabitethernet<br/><i>two_port</i>   tengigabitethernet<br/><i>te_port</i> }</b> | <i>fa_port</i> : (0/1..24);<br><i>gi_port</i> : (0/1..48);<br><i>two_port</i> : (0/1..8);<br><i>te_port</i> : (0/1..11) | Show port or port group configuration. |

## 4.9 Selective Q-in-Q

This feature allows adding an external SPVLAN (Service Provider's VLAN) and replace the Customer VLAN on the basis of filtering rules configured by internal VLAN (Customer VLAN) numbers.

A list of rules based on which traffic will be processed, is created for the device.

Command line prompt in the interface configuration mode is as follows:

```
console# configure terminal  
console(config)# interface{fastethernet fa_port | gigabitethernet gi_port  
| gitengigabitethernet te_port | port-channel group | range{...}}  
console(config-if)#
```

Table 60 — Ethernet interface (interface range) configuration mode commands

| <b>Command</b>                                                                                                 | <b>Value/Default value</b>                                               | <b>Action</b>                                                                                                                                                                                                                                                                                                                                                                                   |

## 4.10 Storm control for different traffic (broadcast, multicast, unknown unicast)

A "storm" occurs due to an excessive number of broadcast, multicast, unknown unicast messages simultaneously transmitted over the network via one port, which leads to an overload of network resources and delays. A storm also can be caused by loopback segments of an Ethernet network.

The switch evaluates the rate of incoming broadcast, multicast and unknown unicast traffic for port with enabled Broadcast Storm Control and drops packets if the rate exceeds the specified maximum value.

## Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 62 — Global configuration mode commands

| <b>Command</b>                         | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                |
|----------------------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>storm-control mode {kbps   pps}</b> | -/pps                      | Globally set the measurement units to be used.<br>- <b>pps</b> — traffic volume in packets per second;<br>- <b>kbps</b> — traffic volume in kbit per second. |

## Ethernet interface configuration mode commands

Command line prompt in the Ethernet or port group interface configuration mode is as follows:

```
console(config-if)#
```

Table 63 — Ethernet interface configuration mode commands

| <b>Command</b>                                          | <b>Value/Default value</b>               | <b>Action</b>                                                                                                                                         |

| <b>show interface</b> [fastethernet fa_port   gigabitethernet gi_port   twopointfivegigabitethernet two_port   tengigabitethernet te_port   port-channel group] <b>storm-control</b> | fa_port: (0/1..24);<br>gi_port: (0/1..48);<br>two_port: (0/1..8);<br>te_port: (0/1..11);<br>group: (1..24) | Show the configuration of the storm monitoring function for the specified port, or all ports. |
| <b>show storm-control</b>                                                                                                                                                            | -                                                                                                          | Display the current unit setting.                                                             |

## 4.11 Link Aggregation Groups (LAG)

Switches provide support for LAG according to the Table 9 (the "LAG" row). Each port group must consist of Ethernet interfaces with the same speed, operating in duplex mode. Combining ports into a group increases bandwidth between interacting devices and improves fault tolerance. The port group is a single logical port for the switch.

The device supports two port group operating modes: static group and LACP group. LACP work is described in the corresponding configuration section.

**To add an interface into a group, you have to restore the default interface settings if they were modified.**

Adding interfaces to the link aggregation group is only available in the Ethernet interface configuration mode.

Command line prompt in the Ethernet interface configuration mode is as follows:

```
console(config-if) #
```

Table 65 — Ethernet interface configuration mode commands

| Command                                                 | Value/Default value                            | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>channel-group</b> group mode {on   active   passive} | group: (1..24);<br>mode: (on, active, passive) | Add an Ethernet interface to a port group.<br>- On – add the interface to a static group of ports;<br>- Active – add the interface to the LACP group, while sending PDUs is always carried out;<br>- Passive – add the interface to the LACP group, while sending PDUs is carried out only if the device receives a PDU from a neighboring device.<br> <b>If the MTU value for the Ethernet and Port-Channel interfaces are different, then this Ethernet interface cannot be added to the port group.</b> |
| <b>no channel-group</b>                                 |                                                | Remove an Ethernet interface from a port group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console# configure terminal
console(config)#
```

Table 66 — Global configuration mode commands

| Command                                                                                                                                                | Value/Default value | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| set port-channel independent-mode enable                                                                                                               |                     | Enable the LAG offline mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| set port-channel independent-mode disable                                                                                                              |                     | Disable the LAG offline mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

On MES2424 and MES2448 devices, the selected balancing algorithm will work only for traffic with a learned address in the MAC table.

If there is not the traffic destination MAC address of the traffic destination in the table, balancing will be performed using the following methods:

- L2-traffic – src-dest-mac;
- L3-traffic(IPv4/IPv6) – src-dest-ip.

### 4.11.1 Static link aggregation groups

Static LAG groups are used to aggregate multiple physical links into one, which allows to increase bandwidth of the channel and increase its fault tolerance. For static groups, the priority of links in an aggregated linkset is not specified.

To enable an interface to operate in a static group, use the **channel-group {group}** mode on command in the configuration mode of the corresponding interface.

### 4.11.2 LACP link aggregation protocol

Link Aggregation Control Protocol (LACP) is used to combine multiple physical links into a single one. Link aggregation is used to increase link bandwidth and improve fault tolerance. LACP allows transmitting traffic over unified channels according to predefined priorities.

To enable the interface operation via LACP protocol use the **channelgroup {group} mode active/passive** command in the configuration mode of the corresponding interface.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 67 — Global configuration mode commands

| Command                                | Value/Default value | Action                     |
|----------------------------------------|---------------------|----------------------------|
| <b>lacp system-priority value</b>      | value: (0..65535)/1 | Set the system priority.   |
| <b>no lacp system-priority</b>         |                     | Set the default value.     |
| <b>lacp system-identifier mac_addr</b> | -                   | Set the lacp member id.    |
| <b>no lacp system-identifier</b>       |                     | Delete the lacp member id. |

#### Ethernet interface configuration mode commands

Command line prompt in the Ethernet interface configuration mode is as follows:

```
console(config-if)#
```

Table 68 — Ethernet interface configuration mode commands

| Command                            | Value/Default value | Action                                                                                                                      |
|------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>lacp timeout {long   short}</b> | -/long              | Set the LACP protocol administrative timeout:<br>- <b>long</b> — long timeout time;<br>- <b>short</b> — short timeout time. |
| <b>no lacp timeout</b>             |                     | Set the default value.                                                                                                      |
| <b>lacp port-priority value</b>    | value: (1..65535)/1 | Set the priority of the Ethernet interface.                                                                                 |
| <b>no lacp port-priority</b>       |                     | Set the default value.                                                                                                      |

#### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 69 — EXEC mode commands

| Command                                                          | Value/Default value | Action                                    |
|------------------------------------------------------------------|---------------------|-------------------------------------------|
| <b>show lacp {port_chanel_id} {neighbor [detail]   counters}</b> | -                   | Show information about the LACP protocol. |
| <b>show etherchannel summary</b>                                 | -                   | View information about the LAG.           |
| <b>show etherchannel detail</b>                                  | -                   | View detailed information about the LAG.  |
| <b>show etherchannel load-balance</b>                            | -                   | View the LAG balancing algorithm.         |
| <b>show etherchannel protocol</b>                                | -                   | View the LAG protocol.                    |
| <b>show etherchannel port</b>                                    | -                   | View information about ports in the LAG.  |
| <b>show etherchannel port-channel</b>                            | -                   | View information about the LAG.           |

## Configuration example:

```
console(config)# set port-channel enable
console(config)# interface port-channel 1
console(config-if)# no shutdown
console(config-if)# exit
console(config)# interface range gi 0/1-2
console(config-if-range)# no shutdown
console(config-if-range)# channel-group 1 mode active
```

## 4.12 IPv4 addressing configuration

This section describes commands to configure static IP addressing parameters such as IP address, subnet mask, default gateway.

### VLAN interface configuration mode commands

Command line prompt in the VLAN interface configuration mode is as follows:

```
console(config-if)#
```

Table 70 — Interface configuration mode commands

| Command                                                                                                                                                                                                                                                                        | Value/Default value                                                                                                                           | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip address</b> <i>ip_address</i><br><i>{ip_mask</i><br><i> prefix_length}</i> [ <b>secondary</b><br><i>{ip_address {ip_mask</i><br><i> prefix_length} }</i> ]                                                                                                               | —                                                                                                                                             | Assign IP addresses and subnet masks to the specified interface.<br>- <b>secondary</b> — allows configuring additional IPv4 addresses for the current interface vlan. The configuration requires the presence of a primary IPv4 address on the interface.                                                                                                                                                                                                                                                                                                                               |

**By default, Vlan interfaces are in the Admin down state. You can bring them to the Admin Up state with the no shutdown command.**

Example of configuring traffic processing from S-vlan 10, C-vlan 20 on the CPU:

```
console# !
console(config)# interface vlan 20
console(config-vlan)# ip management outer-vlan 10
```

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 71 — Privileged EXEC mode commands

| Command                                      | Value/Default value        | Action                                                            |
|----------------------------------------------|----------------------------|-------------------------------------------------------------------|
| <b>renew dhcp vlan</b> <i>vlan_id</i>        | <i>vlan_id</i> : (1..4094) | Send a request to the DHCP server to update the IP address.       |
| <b>show ip interface vlan</b> <i>vlan_id</i> | <i>vlan_id</i> : (1..4094) | Show the IP addressing configuration for the specified interface. |

## 4.13 IPv6 addressing configuration

### 4.13.1 IPv6 protocol

The switches support IPv6, which is a great advantage, because IPv6 is designed to completely replace IPv4 addressing in the future. Compared to IPv4, IPv6 has an extended address space — 128 bits instead of 32. An IPv6 address is 8 blocks, separated by a colon. Each block contains 16 bits represented as four hexadecimal numbers.

In addition to a larger address space, IPv6 protocol has a hierarchical addressing scheme, provides route aggregation, simplifies routing tables and increases router performance by using neighbor discovery.

If the value of a single group or multiple sequential groups in an IPv6 address is zero — 0000, then the group data can be omitted. For example, the address FE40:0000:0000:0000:0000:0000:AD21:FE43 can be shortened to FE40::AD21:FE43. 2 separated zero groups cannot be shortened due to the occurrence of ambiguity. The largest zero group is shortened.

EUI-64 is an identifier created based on the MAC address of the interface, which is the 64 low-order bits of the IPv6 address. A MAC address is split into two 24-bit parts, between which the FFFE constant is added.

### 4.13.2 IPv6 configuration

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 72 — Global configuration mode commands

| Command                                                                                   | Value/Default value                  | Action                                 |
|-------------------------------------------------------------------------------------------|--------------------------------------|----------------------------------------|
| <b>ipv6 unicast-routing</b>                                                               | -/enabled                            | Enable routing between ipv6 prefixes.  |
| <b>no ipv6 unicast-routing</b>                                                            |                                      | Disable routing between ipv6 prefixes. |
| <b>ipv6 neighbor</b> <i>ipv6_address</i><br><b>vlan</b> <i>vlan_id</i> <i>MAC-address</i> | <i>ipv6_address</i> :<br>XXXX::XXXX; | Create a static ipv6 neighbor entry.   |

|                                                                                                                                                                                                                                 |                                                                                                                                                               |                                                        |

### VLAN interface configuration mode commands

Command line prompt in the VLAN interface configuration mode is as follows:

```
console (config-if) #
```

Table 73 — Interface configuration mode commands

| <b>Command</b>                                                                                              | <b>Value/Default value</b>                               | <b>Action</b>                                                                                                               |
|-------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6 enable</b>                                                                                          | -/Off                                                    | Enable IPv6 protocol operation on the interface. Generate an ipv6 link-local address on this interface.                     |
| <b>no ipv6 enable</b>                                                                                       |                                                          | Disable the IPv6 protocol on the interface.                                                                                 |
| <b>ipv6 address</b> <i>ipv6_address prefix-length link-local cga</i>                                        | ipv6_address:<br>XXXX::XXXX;<br>prefix-length: (0-128)   | Set the ipv6 link-local address on the interface.                                                                           |
| <b>no ipv6 address</b> <i>ipv6_address prefix-length link-local</i>                                         |                                                          | Delete the ipv6 link-local address on the interface.                                                                        |
| <b>ipv6 address</b> <i>ipv6_address prefix-length</i> [ <b>unicast</b>   <b>anycast</b>   <b>eui64</b> ]    | ipv6_address:<br>XXXX::XXXX;<br>prefix-length: (0-128)/- | Configure the specified ipv6 address on the interface.<br>- <b>eui64</b> — use the EUI-64 algorithm to generate an address. |
| <b>no ipv6 address</b> <i>ipv6_address prefix-length</i> [ <b>unicast</b>   <b>anycast</b>   <b>eui64</b> ] |                                                          | Delete the specified address from the interface.                                                                            |

### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 74 — EXEC mode commands

| <b>Command</b>                                                                                       | <b>Value/Default value</b> | <b>Action</b>                                         |
|------------------------------------------------------------------------------------------------------|----------------------------|-------------------------------------------------------|
| <b>show ipv6 interface</b> [ <b>vlan</b> <i>vlan</i> ]                                               | -                          | Display the status and settings of IPv6 interfaces.   |
| <b>show ipv6 route</b><br>[ <b>connected</b>   <b>static</b>   <b>summary</b>   <i>ipv6-prefix</i> ] | -                          | Display the routing table for IPv6.                   |
| <b>show ipv6 traffic</b> [ <b>interface</b> <i>vlan {vlan-id/vfi-id}</i> ] [ <b>hc</b> ]             | -                          | Display statistics on received and sent IPv6 packets. |

## 4.14 Protocol configuration

### 4.14.1 ARP configuration

ARP (Address Resolution Protocol) — link layer protocol that performs the MAC address determination function based on the IP address contained in the request.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config) #
```

Table 75 — Global configuration mode commands

| Command                                                                 | Value/Default value                                                                                             | Action                                                                                                                                                                           |
|-------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>arp</b> <i>ip_addr</i> <i>hw_addr</i> [ <i>vlan</i> <i>vlan_id</i> ] | ip_addr format:<br>A.B.C.D;<br>hw_address format:<br>H.H.H<br>H:H:H:H:H:H<br>H-H-H-H-H-H;<br>vlan_id: (1..4094) | Add a static IP and MAC address mapping entry to the ARP table for the VLAN specified in the command.<br>- <b>ip_address</b> — IP address;<br>- <b>hw_address</b> — MAC address. |
| <b>no arp</b> <i>ip_addr</i>                                            |                                                                                                                 | Delete a static IP and MAC address mapping entry from the ARP table for the IP address specified in the command.                                                                 |

| <b>show ip arp statistics</b>                                                       | -                                                                                                                  | Show the current statistics of the arp protocol.                                                                                                                     |
| <b>clear ip arp</b>                                                                 | -                                                                                                                  | Delete all dynamic entries from the ARP table.                                                                                                                       |

### 4.14.2 Loopback detection mechanism

This mechanism allows the device to detect loopback ports. A loop on the port is detected by sending a frame with the MAC address of the switch port in the Source MAC field and the broadcast (default) address in the Destination MAC field.

## Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 78 — Global configuration mode commands

| Command                                                      | Value/Default value            | Action                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>shutdown loopback-detection</b>                           | -/enabled                      | Disable the loopback-detection module on the device.<br> <b>This command disables the operation of the loopback-detection module and permanently deletes all settings of the LBD block.</b> |
| <b>no shutdown loopback-detection</b>                        |                                | Enable the operation of the loopback-detection module on the device.                                                                                                                                                                                                           |

## Ethernet or port group interface (interface range) configuration mode commands

Command line prompt in the Ethernet or port group interface configuration mode is as follows:

```
console# configure terminal
console(config)# interface { fastethernet fa_port | gigabitethernet
gi_port | twopointfivegigabitethernet two_port | tengigabitethernet
te_port | port-channel group}
console(config-if)#
```

Table 79 — Ethernet interface configuration mode commands

| Command                    | Value/Default value | Action                                           |
|----------------------------|---------------------|--------------------------------------------------|
| loopback-detection enable  | -/off               | Enable the loop detection mechanism on the port. |
| loopback-detection disable |                     | Restore the default value.                       |

### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 80 — EXEC mode commands

| Command                                                                                                                                                                  | Value/Default value                                                                     | Action                                                      |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|-------------------------------------------------------------|
| show loopback-detection<br>[fastethernet fa_port  <br>gigabitethernet gi_port  <br>twopointfivegigabitethernet<br>two_port   tengigabitethernet<br>te_port   statistics] | fa_port: (0/1..24);<br>gi_port: (0/1..48);<br>two_port: (0/1..8);<br>te_port: (0/1..11) | Display the status of the loopback-detection mechanism.     |

### 4.14.3 STP (STP, RSTP, MSTP, RPVST+<sup>1</sup>)

The main task of STP (Spanning Tree Protocol) is to bring an Ethernet network with multiple links to a tree topology that excludes packet cycles. Switches exchange configuration messages using frames in a specific format and selectively enable or disable traffic transmission to ports.

Rapid STP (RSTP) is the enhanced version of STP that enables faster convergence of a network to a tree topology and provides higher stability.

Multiple STP (MSTP) is the most advanced STP implementation that supports VLAN use. MSTP involves configuring the required number of spanning tree instances regardless of the number of VLAN groups on the switch. Each instance can contain multiple VLAN groups. However, a drawback of MSTP is that all MSTP switches should have the same VLAN group configuration.

**The maximum allowed number of MSTP instances is 64.**

#### 4.14.3.1 STP, RSTP configuration

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

<sup>1</sup> The function is supported only for MES2424, MES2424B, MES2424FB, MES2424P, MES2410-08DP, MES2410-08DU, MES2420-48P, MES2420B-24D, MES2448, MES2448B, MES2448P, MES2411X, MES3400-24, MES3400-24F, MES3400-48, MES3400-48F, MES3710P models.

Table 81 — Global configuration mode commands

| Command                                        | Value/Default value            | Action                                                                                                                                                                                                                                                                                                                                                                                                              |

|-----------------------------------------------------|----|---------------------------------------------------|
| spanning-tree {restricted-role   restricted-tcn}    | -/ | Enable the anti-attack feature on the interface.  |
| no spanning-tree {restricted-role   restricted-tcn} |    | Disable the anti-attack feature on the interface. |

Table 83 — Default path cost (spanning-tree cost)

| Interface | Method for determining the path cost |       |
|-----------|--------------------------------------|-------|
|           | Long                                 | Short |
| 10M       | 2000000                              | 100   |
| 100M      | 200000                               | 19    |
| 1G        | 20000                                | 4     |
| 10G       | 2000                                 | 2     |
| LAG 10M   | 999900                               | 56    |
| LAG 100M  | 99900                                | 12    |
| LAG 1G    | 9900                                 | 3     |
| LAG 10G   | 900                                  | 2     |

By default, the cost of the path for a group of channels using the long method is determined by dividing the cost of the interface by the number of links in the group (100). The cost value for LAG is given taking into account the membership of 2 physical interfaces in it.

#### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 84 — Privileged EXEC mode commands

| Command                                                                                                                                                                                                                                                                                              | Value/Default value                                                                                        | Action                                                          |

### 4.14.3.2 Configuring MSTP

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 85 — Global configuration mode commands

| Command                                                                   | Value/Default value                                    | Action                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>spanning-tree mst instance_id priority priority</b>                    | instance_id: (1..63);<br>priority:<br>(0..61440)/32768 | Set the priority of the switch over others switches using a shared MSTP instance.<br>- <i>instance_id</i> — MST instance;<br>- <i>priority</i> — the switch priority.<br> <b>The priority value should be a multiple of 4096.</b>        |
| <b>no spanning-tree mst instance_id priority</b>                          |                                                        | Set the default value.                                                                                                                                                                                                                                                                                                    |
| <b>spanning-tree mst instance_id flush-indication-threshold threshold</b> | instance_id: (1..63);<br>threshold: (0..65535)/0       | Set the TCN BPDU threshold value for the MST instance at which the timer starts.                                                                                                                                                                                                                                          |
| <b>spanning-tree mst max-hops hop_count</b>                               | hop_count: (6..40)/20                                  | Set the maximum amount of hops for BPDU packet that are required to build a tree and to keep information on its structure. If the packet has already passed the maximum amount of transit hops, it will be dropped on the next section.<br>- <i>hop_count</i> — the maximum number of transit sections for a BPDU packet. |
| <b>no spanning-tree mst max-hops</b>                                      |                                                        | Set the default value.                                                                                                                                                                                                                                                                                                    |
| <b>spanning-tree mst configuration</b>                                    | -                                                      | Enter the MSTP protocol configuration mode.                                                                                                                                                                                                                                                                               |

#### MSTP configuration mode commands

Command line prompt in the MSTP configuration mode is as follows:

```
console# configure terminal
console (config)# spanning-tree mst configuration
console (config-mst)#
```

Table 86 — MSTP configuration mode commands

| Command                                        | Value/Default value                           | Action                                                                                                                                                  |
|------------------------------------------------|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>instance instance_id vlan vlan_range</b>    | instance_id:(1..63);<br>vlan_range: (1..4094) | Create a mapping between MSTP instance and VLAN groups.<br>- <i>instance-id</i> — MSTP instance identifier.<br>- <i>vlan-range</i> — VLAN group number. |
| <b>no instance instance_id vlan vlan_range</b> |                                               | Delete the mapping between MSTP instance and VLAN groups.                                                                                               |
| <b>name string</b>                             | string: (1..32)<br>characters                 | Set the name of the MST configuration.<br>- <i>string</i> — MST configuration name.                                                                     |
| <b>no name</b>                                 |                                               | Delete the name of the MST configuration.                                                                                                               |
| <b>revision value</b>                          | value: (0..65535)/0                           | Set the revision number of the MST configuration.<br>- <i>value</i> — MST configuration revision number.                                                |
| <b>no revision</b>                             |                                               | Set the default <i>value</i> .                                                                                                                          |
| <b>exit</b>                                    | -                                             | Exit the MSTP protocol configuration mode without saving the configuration.                                                                             |

#### Ethernet or port group interface configuration mode commands

Command line prompt in the Ethernet or port group interface configuration mode is as follows:

```
console(config-if)#
```

Table 87 — Ethernet or port group interface configuration mode commands

| Command                                                                                                      | Value/Default value                             | Action                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>spanning-tree guard root</b>                                                                              | -/protection disabled                           | Enable root protection for all STP trees on the selected port. This protection prohibits the interface to be the root port of the switch.                                                                                                                                                         |
| <b>no spanning-tree guard</b>                                                                                |                                                 | Set the default value.                                                                                                                                                                                                                                                                            |
| <b>spanning-tree mst <i>instance_id</i> port-priority <i>priority</i></b>                                    | instance_id: (1..63);<br>priority: (0..240)/128 | Set the priority of the interface in the MSTP instance.<br>- <i>instance-id</i> — MSTP instance identifier;<br>- <i>priority</i> — interface priority.<br> <b>The priority value should be a multiple of 16.</b> |
| <b>no spanning-tree mst <i>instance_id</i> port-priority</b>                                                 |                                                 | Set the default value.                                                                                                                                                                                                                                                                            |
| <b>spanning-tree mst <i>instance_id</i> cost <i>cost</i></b>                                                 | instance_id: (1..63);<br>cost: (1..200000000)   | Set the path cost via the selected interface for the particular instance of MSTP.<br>- <i>instance-id</i> — MSTP instance identifier.<br>- <i>cost</i> — path cost;                                                                                                                               |
| <b>no spanning-tree mst <i>instance_id</i> cost</b>                                                          |                                                 | Set the value based on the port speed and the path cost calculation method, see table 83.                                                                                                                                                                                                         |
| <b>spanning-tree port-priority <i>priority</i></b>                                                           | priority: (0..240)/128                          | Set the priority of the interface in the MSTP root spanning tree.<br> <b>The priority value should be a multiple of 16.</b>                                                                                      |
| <b>no spanning-tree port--priority</b>                                                                       |                                                 | Set the default value.                                                                                                                                                                                                                                                                            |
| <b>spanning-tree mst <i>instance_id</i> pseudoRootid priority <i>priority</i> mac-address <i>mac_add</i></b> | instance_id: (1..63);<br>priority: (0..240)/128 | Set the priority of pseudoroot in the MSTP instance.                                                                                                                                                                                                                                              |
| <b>no spanning-tree mst <i>instance_id</i> pseudoRootid</b>                                                  |                                                 | Set the default value.                                                                                                                                                                                                                                                                            |
| <b>spanning-tree mst <i>instance_id</i> guard {root/none}</b>                                                | instance_id: (1..63);<br>-/none                 | Enable or disable the spanning-tree Root Guard in the specified MST instance.                                                                                                                                                                                                                     |

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 88 — Privileged EXEC mode commands

| Command                                                                                                                                                                                                                                                                                                                                          | Value/Default value                                                                                                                 | Action                                                     |

| <b>show spanning-tree mst configuration</b>                                                                                                                                                                                                                                                                                                      | -                                                                                                                                   | Show information on configured MSTP instances.             |
| <b>clear spanning-tree mst <i>instance_id</i> counters {interface {fastethernet <i>fa_port</i>   gigabitethernet <i>gi_port</i>   twopointfivegigabitethernet <i>two_port</i>   tengigabitethernet <i>te_port</i>   port-channel <i>group</i>}}</b>                                                                                              | Instance_id: (1..63);<br>fa_port: (0/1..24);<br>gi_port: (0/1..48);<br>two_port: (0/1..8);<br>te_port: (0/1..11);<br>group: (1..24) | Clear STP counters.                                        |

### 4.14.3.3 Configuring the Rapid-PVST+ protocol <sup>1</sup>

A total of 64 RPVST instances are supported. In this case, zero is used for all VLANs where RPVST is disabled. One RPVST instance corresponds to each VLAN with RPVST enabled.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console (config) #
```

Table 89 — Global configuration mode commands

| Command                             | Value/Default value | Action                                                        |
|-------------------------------------|---------------------|---------------------------------------------------------------|
| spanning-tree vlan <i>vlan</i>      | vlan: (1..4094)     | Enable STP in the selected vlan.<br>- vlan — the VLAN number. |
| no spanning-tree vlan <i>vlan i</i> |                     | Turn off STP in the selected vlan.                            |

#### VLAN configuration mode commands (range of VLANs)

```
console# configure terminal
console (config) # vlan 1,3,7
console (config-vlan-range) #
```

Table 90 — VLAN configuration mode commands

| Command                                   | Value/Default value            | Action                                                                                                    |
|-------------------------------------------|--------------------------------|-----------------------------------------------------------------------------------------------------------|
| spanning-tree forward-time <i>seconds</i> | seconds: (4..30)/15<br>seconds | Set the time interval spent listening and studying the states before switching to the transmission state. |
| no spanning-tree forward-time             |                                | Set the default value.                                                                                    |
| spanning-tree hello-time <i>sec-onds</i>  | seconds: (1..10)/2 sec         | Set the time interval between broadcasts of "Hello" messages to the interacting switches.                 |
| no spanning-tree hello-time               |                                | Set the default value.                                                                                    |
| spanning-tree max-age <i>sec-onds</i>     | seconds: (6..40)/20 sec        | Set the STP lifetime.                                                                                     |
| no spanning-tree max-age                  |                                | Set the default value.                                                                                    |
| spanning-tree priority <i>prior_val</i>   | prior_val:<br>(0..61440)/32768 | Set the device priority in the STP spanning tree.<br>The priority value should be a multiple of 4096.     |
|                                           |                                |                                                                                                           |
|                                           | count: (1..10)/6               | This value indicates the maximum number of packets that can be sent within a given hello-time interval.   |
| no spanning-tree hold-count               |                                | Set the default value.                                                                                    |

When set the forward-time, hello-time, max-age STP parameters, make sure that:  $2 * (\text{Forward-Delay} - 1) \geq \text{Max-Age} \geq 2 * (\text{Hello-Time} + 1)$ .

#### Ethernet or port group interface configuration mode commands

Command line prompt in the Ethernet or port group interface configuration mode is as follows:

```
console (config-if) #
```

<sup>1</sup> The function is supported only for MES2424, MES2424B, MES2424FB, MES2424P, MES2410-08DP, MES2410-08DU, MES2420-48P, MES2420B-24D, MES2448, MES2448B, MES2448P, MES2411X, MES3400-24, MES3400I-24, MES3400-24F, MES3400-48, MES3400-48F, MES3710P models.

Table 91 — Ethernet or port group interface configuration mode commands

| <b>Command</b>                                                         | <b>Value/Default value</b>                                      | <b>Action</b>                                                                                                                                                                                                                   |
|------------------------------------------------------------------------|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>spanning-tree vlan <i>vlan</i> cost</b><br><i>cost</i>              | cost:<br>(1..200000000)/see the<br>table 83;<br>vlan: (1..4094) | Set the path cost via the interface.<br>- <i>cost</i> — path cost;<br>- <i>vlan</i> — VLAN number.                                                                                                                              |
| <b>no spanning-tree vlan <i>vlan</i> cost</b>                          |                                                                 | Set the value based on the port speed and the path cost calculation method, see table 83.                                                                                                                                       |
| <b>spanning-tree vlan <i>vlan</i> port-priority</b><br><i>priority</i> | priority: (0..240)/128;<br>vlan: (1..4094)                      | Set the interface priority in the STP spanning tree.<br>- <i>vlan</i> — VLAN number.<br> <b>The priority value should be a multiple of 16.</b> |
| <b>no spanning-tree vlan <i>vlan</i> port--priority</b>                |                                                                 | Set the default value.                                                                                                                                                                                                          |

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 92 — Privileged EXEC mode commands

| <b>Command</b>                                                                                                                                                                                                                                                                                                                        | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                                                                                          |

#### 4.14.4 Configuring Layer 2 Protocol Tunneling (L2PT) function

Layer 2 Protocol Tunneling (L2PT) allows forwarding of L2-Protocol PDUs through a service provider network which provides transparent connection between client segments of the network.

L2PT encapsulates PDUs on a border switch and transmits them to another border switch which waits for special encapsulated frames and decapsulates them. This allows users to transmit layer 2 data via the service provider network.

## Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console (config) #
```

Table 93 — Global configuration mode commands

| <b>Command</b>                                            | <b>Value/Default value</b>                  | <b>Action</b>                                                                      |
|-----------------------------------------------------------|---------------------------------------------|------------------------------------------------------------------------------------|
| <b>l2protocol-tunnel-address</b><br>multicast-mac-address | multicast-mac-address/<br>01:00:0c:cd:cd:d4 | Set the destination address for encapsulated frames of the corresponding protocol. |
| <b>stp-tunnel-address</b><br>multicast-mac-address        | multicast-mac-address/<br>01:00:0c:cd:cd:d0 | Set the destination address for encapsulated frames of the corresponding protocol. |
| <b>lldp-tunnel-address</b><br>multicast-mac-address       | multicast-mac-address/<br>01:00:0c:cd:cd:d8 | Set the destination address for encapsulated frames of the corresponding protocol. |
| <b>isis-l1-tunnel-address</b><br>multicast-mac-address    | multicast-mac-address/<br>01:00:0c:cd:cd:dc | Set the destination address for encapsulated frames of the corresponding protocol. |
| <b>isis-l2-tunnel-address</b><br>multicast-mac-address    | multicast-mac-address/<br>01:00:0c:cd:cd:dd | Set the destination address for encapsulated frames of the corresponding protocol. |
| <b>vtp-tunnel-address</b><br>multicast-mac-address        | multicast-mac-address/<br>01:00:0c:cd:cd:e0 | Set the destination address for encapsulated frames of the corresponding protocol. |
| <b>ospf-tunnel-address</b><br>multicast-mac-address       | multicast-mac-address/<br>01:00:0c:cd:cd:e1 | Set the destination address for encapsulated frames of the corresponding protocol. |
| <b>rip-tunnel-address</b><br>multicast-mac-address        | multicast-mac-address/<br>01:00:0c:cd:cd:e2 | Set the destination address for encapsulated frames of the corresponding protocol. |
| <b>fctl-l2-tunnel-address</b><br>multicast-mac-address    | multicast-mac-address/<br>01:00:0c:cd:cd:de | Set the destination address for encapsulated frames of the corresponding protocol. |
| <b>igmp-tunnel-address</b><br>multicast-mac-address       | multicast-mac-address/<br>01:00:0c:cd:cd:db | Set the destination address for encapsulated frames of the corresponding protocol. |
| <b>vrrp-tunnel-address</b><br>multicast-mac-address       | multicast-mac-address/<br>01:00:0c:cd:cd:e3 | Set the destination address for encapsulated frames of the corresponding protocol. |

## Ethernet interface configuration mode commands:

Command line prompt in the Ethernet interface configuration mode is as follows:

```
console (config-if) #
```

Table 94 — Ethernet interface configuration mode commands

| <b>Command</b>                                                                                             | <b>Value/Default value</b> | <b>Action</b>                        |
|------------------------------------------------------------------------------------------------------------|----------------------------|--------------------------------------|
| <b>l2protocol-tunnel {stp   l2p   lldp   isis-l1   isis-l2   fctl   ospf   rip   vtp   igmp   vrrp}</b>    | -/off                      | Enable PDU encapsulation mode.       |
| <b>no l2protocol-tunnel {stp   l2p   lldp   isis-l1   isis-l2   fctl   ospf   rip   vtp   igmp   vrrp}</b> |                            | Turn off the PDU encapsulation mode. |

**When encapsulation is enabled for VTP, the entire protocol group with destination MAC addresses 01:00:0C:CC:CC:CC will be encapsulated.**

## Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 95 — Privileged EXEC mode commands

| Command                                                                                                                                                                                                                             | Value/Default value                                                                                                               | Action                                                             |

#### 4.14.5 LLDP configuration

The main function of **Link Layer Discovery Protocol (LLDP)** is the exchange of information about status and specifications between network devices. Information that LLDP gathers is stored on devices and can be requested by the master computer via SNMP. Thus, the master computer can model the network topology based on this information.

The switches support transmission of both standard and optional parameters, such as:

- device name and description;
- port name and description;
- information about MAC/PHY;
- etc.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 96 — Global configuration mode commands

| Command                                                                                                                         | Value/Default value                              | Action                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The LLDP packets received via a port group are saved individually by these port groups. LLDP sends different messages to each port of the group.

LLDP operation is independent from the STP state on the port; LLDP packets are sent and received via ports blocked by STP.

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 98 — Privileged EXEC mode commands

| <b>Command</b>                                                                                                                               | <b>Value/Default value</b> | <b>Action</b>                                                      |
|----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|--------------------------------------------------------------------|
| <b>show lldp local</b><br>[gigabitethernet gi_port  <br>twopointfivegigabitethernet<br>two_port   tengigabitethernet<br>te_port] [mgmt-addr] | -                          | Show the LLDP information that the ports announce.                 |
| <b>show lldp neighbors</b> [detail]                                                                                                          | -                          | Show information on the neighbor devices on which LLDP is enabled. |
| <b>show lldp statistics</b>                                                                                                                  | -                          | Show LLDP statistics.                                              |

Table 99 — Description of the results

| <b>Field</b>    | <b>Description</b>                                                                                                                                                                           |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timer           | Determines how often the device sends LLDP updates.                                                                                                                                          |
| Hold Multiplier | Determine the time period (TTL, Time-To-Live) for the receiving device, during which it is necessary to hold the received LLDP packets before resetting them: TTL = Timer * Hold Multiplier. |
| Reinit delay    | Determine the minimum time period during which the port will wait before sending the next LLDP message.                                                                                      |
| Tx delay        | Specify the delay between subsequent transfers of LLDP frames initiated by changes in values or status.                                                                                      |
| Port            | Port number.                                                                                                                                                                                 |
| State           | Port operation mode for LLDP.                                                                                                                                                                |

|               |                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Optional TLVs | TLV options passed<br>Possible values:<br>PD — Port Description;<br>SN — System Name;<br>SD — System Description;<br>SC — System Capabilities. |
| Address       | Device address sent in LLDP messages.                                                                                                          |
| Notifications | Specify whether LLDP notifications are enabled or disabled.                                                                                    |

| Port description                         | Neighbor device port description.                                                                                                                                                                        |
| Management address                       | Device management address.                                                                                                                                                                               |
| Auto-negotiation support                 | Specify if the automatic port mode identification is supported.                                                                                                                                          |
| Auto-negotiation status                  | Specify if the automatic port mode identification is supported.                                                                                                                                          |
| Auto-negotiation Advertised Capabilities | Specify the modes supported by automatic port discovery function.                                                                                                                                        |
| Operational MAU type                     | Operational MAU type of the device.                                                                                                                                                                      |

Example of configuring TLV options on the Gigabitethernet 0/1 interface:

```
console(config)# set lldp enable
console(config)# interface gigabitethernet 0/1
console(config-if)# lldp tlv-select basic-tlv port-descr
console(config-if)# lldp tlv-select basic-tlv sys-name
console(config-if)# lldp tlv-select basic-tlv sys-descr
console(config-if)# lldp tlv-select basic-tlv sys-capab
console(config-if)# lldp tlv-select basic-tlv mgmt-addr ipv4 10.0.0.1
console(config-if)# lldp tlv-select dot1tlv port-vlan-id
console(config-if)# lldp tlv-select dot1tlv protocol-vlan-id all
console(config-if)# lldp tlv-select dot3tlv macphy-config
console(config-if)# lldp tlv-select dot3tlv link-aggregation
console(config-if)# lldp tlv-select dot3tlv max-framesize
```

#### 4.14.6 Configuring G.8032v2 (ERPS)

ERPS (Ethernet Ring Protection Switching) protocol is used for increasing stability and reliability of data transmission network having a ring topology by reducing the network recovery time in case of a failure. Recovery time does not exceed 1 second. It is much less than network change over time in case of spanning tree protocols usage.

**ERPS is supported only on MES2424, MES2424B, MES2424FB, MES2424P, MES2448, MES2448B, MES2448P, MES2410-08DP, MES2410-08DU, MES2420-48P, MES2420B-24D, MES2411X, MES3400-24, MES3400I-24, MES3400-24F, MES3400-48, MES3400-48F, MES3710P models.**

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 101 — Global configuration mode commands

| Command                                                        | Value/Default value                                  | Action                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| shutdown aps ring                                              | -/off                                                | Disable the ERPS module operation on the device.<br> <b>This command disables the operation of the ERPS module and permanently deletes all settings of the ERPS block.</b> |
| no shutdown aps ring                                           |                                                      | Allow the ERPS module operation on the device.                                                                                                                                                                                                              |

#### ERPS configuration mode commands

Command line prompt in the ERPS ring configuration mode is as follows:

```
console# configure terminal
console (config)# aps ring group 1
console (config-ring)#
```

Table 102 — EPRS ring configuration mode commands:

| Command                                                                                                                      | Value/Default value                                                                              | Action                                                                                                                                                                            |

| <b>show aps ring configuration</b>                       | -                          | Show information about the ring configuration.                                                   |
| <b>show aps ring global info</b>                         | -                          | Show information about the state of the ERPS module.                                             |
| <b>show aps ring group</b> <i>ring id</i>                | id: (1..4294967295)        | Show information about the state of a particular ring.                                           |
| <b>show aps ring statistics</b>                          | -                          | Output statistics for all ring ports.                                                            |
| <b>show aps ring timers</b>                              | -                          | Show information about all ERPS timers.                                                          |
| <b>show aps ring vlan-group</b> { <i>vlan-group-id</i> } | vlan-group-id: (0..64)     | Show information about the vlan in the vlan group.                                               |

### Example of configuring ERPS

Configure a ring with ID 1. Vlan 1000 (r-aps vlan) is used to pass service erps traffic in the ring, vlans 1-999 are protected and added to 1 vlan group. Port te0/1 is the west port, te0/2 is the east port, te0/1 is the rpl owner.

```
console(config)#vlan 2-1000
console(config-vlan)#vlan active
console(config-vlan)#exit
console(config)#no shutdown aps ring
console(config)#aps ring enable
console(config)#aps ring vlan-group-manager erps
console(config)#aps ring map vlan-group 1 add 1-1000
console(config)#aps ring group 1
console(config-ring)#aps working level 1
console(config-ring)#aps working west tengigabitethernet 0/1 east
tengigabitethernet 0/2 vlan 1000
```

```
console(config-ring) #aps owner tengigabitethernet 0/1
console(config-ring) #aps protection-type service-based
console(config-ring) #aps map vlan-group 1
console(config-ring) #aps group active
```

## 4.15 Configuring OAM

Ethernet OAM (Operation, Administration and Maintenance), IEEE 802.3ah — Data link layer functions correspond to a channel status monitoring protocol. The protocol uses OAM (OAMPDU) protocol data blocks to transmit channel status information between directly connected Ethernet devices. Both devices should support IEEE 802.3ah.

### Ethernet interface configuration mode commands:

Command line prompt in the Ethernet interface configuration mode is as follows:

```
console(config-if) #
```

**The Ethernet OAM configuration is required to send snmp traps on the Dying Gasp event.**

Table 104 — Ethernet interface configuration mode commands

| Command                                                     | Value/Default value         | Action                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| shutdown ethernet-oam                                       | -/enabled                   | Disable the Ethernet OAM module operation on the device.<br> <b>The command disables the operation of the Ethernet OAM module and permanently deletes all settings of the OAM block.</b>                             |
| no shutdown ethernet-oam                                    |                             | Enable the operation of the Ethernet OAM module on the device.                                                                                                                                                                                                                                          |
| shutdown fault-management                                   | -/enabled                   | Disable the operation of the Fault-management module on the device.<br> <b>The command disables the operation of the Fault-management module and permanently deletes all settings of the Fault-management block.</b> |
| no shutdown fault-management                                |                             | Enable the operation of the Fault-management module on the device.                                                                                                                                                                                                                                      |
| ethernet-oam enable                                         | -/off                       | Allow OAM operation.                                                                                                                                                                                                                                                                                    |
| ethernet-oam disable                                        |                             | Prohibit OAM operation.                                                                                                                                                                                                                                                                                 |
| ethernet oam link-monitor frame threshold count             | count: (1..900)/1           | Set the threshold for the number of errors for the specified period (the period is set by the <b>ethernet oam link-monitor frame window</b> command).                                                                                                                                                   |
| no ethernet-oam link-monitor frame threshold                |                             | Restore the default value.                                                                                                                                                                                                                                                                              |
| ethernet-oam link-monitor frame window window               | window: (10..600)/100 ms    | Set a time interval for counting the number of errors.                                                                                                                                                                                                                                                  |
| no ethernet-oam link-monitor frame window                   |                             | Restore the default value.                                                                                                                                                                                                                                                                              |
| ethernet-oam link-monitor frame-period threshold count      | count: (1..900)/1           | Set the threshold for the "frame-period" event (the period is set by the <b>ethernet oam link-monitor frame-period window</b> command).                                                                                                                                                                 |
| no ethernet-oam link-monitor frame-period threshold         |                             | Restore the default value.                                                                                                                                                                                                                                                                              |
| ethernet-oam link-monitor frame-period window window        | window: (0xffff../123456..) | Set the time interval for the "frame-period" event.                                                                                                                                                                                                                                                     |
| no ethernet-oam link-monitor frame-period window            |                             | Restore the default value.                                                                                                                                                                                                                                                                              |
| ethernet oam link-monitor frame-sec-summary threshold count | count: (1..900)/1           | Set the threshold for the "frame-sec-summary" event (the period is set by the <b>Ethernet oam link-monitor frame-sec-summary window</b> command), in seconds.                                                                                                                                           |
| no ethernet-oam link-monitor frame-sec-summary threshold    |                             | Restore the default value.                                                                                                                                                                                                                                                                              |

|                                                                        |                               |                                                                                                                                                                                                                                                         |
|------------------------------------------------------------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ethernet-oam link-monitor<br>frame-sec-summary window<br>window        | window: (100..9000)/100<br>ms | Set the time interval for the "frame-sec-summary" event.                                                                                                                                                                                                |
| no ethernet-oam link-monitor<br>frame-seconds window                   |                               | Restore the default value.                                                                                                                                                                                                                              |
| ethernet-oam mode<br>{active   passive}                                | -/active                      | Set the operating mode of the OAM protocol:<br>- <b>active</b> — the switch is constantly sending OAM PDUs;<br>- <b>passive</b> — the switch starts sending OAM PDUs only if there is an OAM PDU on the opposite side.                                  |
| ethernet oam<br>remote-loopback {deny  <br>disable   enable   permit}  | -/off                         | A command to manage support for the traffic loopback feature.<br>- <b>deny</b> — ignores loopback commands;<br>- <b>disable</b> — blocks loopback;<br>- <b>enable</b> — enables control for loopback;<br>- <b>permit</b> — enables loopback processing. |
| ethernet-oam uni-directional<br>detection                              | -/off                         | Enable the unidirectional link detection function based on the Ethernet OAM protocol.                                                                                                                                                                   |
| no ethernet-oam<br>uni-directional detection                           |                               | Restore the default value.                                                                                                                                                                                                                              |
| ethernet-oam uni-directional<br>detection action<br>{log   errdisable} | -/log                         | Determine the switch response to unidirectional link:<br>- <b>log</b> — log entry;<br>- <b>errdisable</b> — set the port to the "error-disable" state, enable logging and sending SNMP traps.                                                           |

| <b>show port ethernet-oam</b>                                                                                                                                                                        | -                                                                                        | Show information about the current state of OAM.                          |
| <b>show port ethernet-oam {fastethernet fa_port   gigabitethernet gi_port   twopointfivegigabitethernet two_port   tengigabitethernet te_port}</b>                                                   | fa_port: (0/1..24);<br>gi_port: (0/1..48);<br>two_port: (0/1..8);<br>te_port: (0/1..11). | Show information about the current state of OAM for a specific interface. |
| <b>show port ethernet-oam [fastethernet fa_port   gigabitethernet gi_port   twopointfivegigabitethernet two_port   tengigabitethernet te_port] neighbor</b>                                          | fa_port: (0/1..24);<br>gi_port: (0/1..48);<br>two_port: (0/1..8);<br>te_port: (0/1..11). | Show the state of the adjacent configuration.                             |
| <b>show port ethernet-oam [fastethernet fa_port   gigabitethernet gi_port   twopointfivegigabitethernet two_port   twopointfivegigabitethernet two_port   tengigabitethernet te_port] statistics</b> | fa_port: (0/1..24);<br>gi_port: (0/1..48);<br>two_port: (0/1..8);<br>te_port: (0/1..11). | Show OAM statistics for interfaces/a specific interface.                  |
| <b>show port ethernet-oam{ fastethernet fa_port   gigabitethernet gi_port   twopointfivegigabitethernet two_port   tengigabitethernet te_port } event-notifications</b>                              | fa_port: (0/1..24);<br>gi_port: (0/1..48);<br>two_port: (0/1..8);<br>te_port: (0/1..11). | Show OAM port settings.                                                   |
| <b>show ethernet-oam global information</b>                                                                                                                                                          | -                                                                                        | Show the global settings of the OAM block.                                |

Example of configuring Ethernet OAM:

```
console(config) # set ethernet-oam enable
console(config) # interface gigabitethernet 0/1
console(config-if) # ethernet-oam enable
```

## 4.16 Multicast addressing

### 4.16.1 Intermediate function of IGMP (IGMP Snooping)

IGMP Snooping function is used in multicast networks. The main task of IGMP Snooping is to forward multicast traffic only to ports that requested it.

**Only IGMPv1, IGMPv2, IGMPv3 versions are supported.**

**The "bridge multicast filtering" group filtering feature is enabled by default.**

Identification of ports which connect multicast routers is based on the following events:

- IGMP requests has been received on the port;
- Protocol Independent Multicast (PIM/PIMv2) packets has been received on the port;
- Distance Vector Multicast Routing Protocol (DVMRP) packets has been received on the port;
- MRDISC protocol packets has been received on the port;
- Multicast Open Shortest Path First (MOSPF) protocol packets has been received on the port.

## Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console (config) #
```

Table 107 — Global configuration mode commands

| Command                                                                                                                                                                                                                                     | Value/Default value                                                                                         | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>no ip igmp snooping authentication forward-first</b>                        | -                          | Return the default value.                                                                                                                                                                                                                                                                                            |
| <b>ip igmp sn authentication exception mcast profile</b> <i>profile</i>        |                            | Link a multicast profile for IGMP authorization to the interface.                                                                                                                                                                                                                                                    |
| <b>no ip igmp sn authentication exception mcast profile</b>                    |                            | Return the default value.                                                                                                                                                                                                                                                                                            |

### Example of setting up a subscription to static groups

```
console# configure terminal
console(config)# vlan 10
console(config-vlan)# vlan active
console(config-vlan)# ip igmp snooping static-group 232.0.0.1
console(config)# ip igmp snooping
console(config)# ip igmp snooping proxy-reporting
```

### MVR configuration example

In the example, gigabitethernet 0/1 is the mrouter-port, fastethernet 0/1 is the client port

```
console(config)# vlan 10,100
console(config-vlan)# vlan active
console(config-vlan)# exit
console(config)# ip mcast profile 1
console(config-profile)# permit
console(config-profile)# range 232.0.0.1 232.0.0.5
console(config-profile)# profile active
console(config-profile)# exit
console(config)# snooping multicast-forwarding-mode ip
console(config)# ip igmp snooping
console(config)# ip igmp snooping vlan 100
console(config)# ip igmp snooping multicast-vlan enable
console(config)# vlan 100
console(config-vlan)# ip igmp snooping multicast-vlan profile 1
console(config)# interface gigabitethernet 0/1
console(config-if)# switchport mode trunk
console(config-if)# exit
console(config)# interface fastethernet 0/1
console(config-if)# switchport mode access
console(config-if)# switchport access vlan 10
console(config-if)# switchport multicast-tv vlan 100
console(config-if)# exit
```

### EXEC mode commands

All commands are available for privileged users only.

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 110 — EXEC mode commands

| <b>Command</b>                                                                                                                                                                                                                                                           | <b>Value/Default value</b>                                                                                 | <b>Action</b>                                                                      |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| <b>show ip igmp snooping mrouter</b>                                                                                                                                                                                                                                     | -                                                                                                          | Show information about learnt multicast routers in the specified VLAN group.       |
| <b>show ip igmp snooping groups</b>                                                                                                                                                                                                                                      | -                                                                                                          | Show information about learnt multicast groups participating in the group mailing. |

| <b>show ip igmp snooping authentication cache</b><br><b>[interface {fastethernet <i>fa_port</i>   gigabitethernet <i>gi_port</i>  </b><br><b>twopointfivegigabitethernet <i>two_port</i>  </b><br><b>tengigabitethernet <i>te_port</i>   port-channel <i>group</i>}]</b> | fa_port: (0/1..24);<br>gi_port: (0/1..48);<br>two_port: (0/1..8);<br>te_port: (0/1..11);<br>group: (1..24) | Viewing the IGMP authorization cache table.                                        |

### 4.16.2 Multicast addressing rules

These commands are used to set multicast addressing rules on the link and network layers of the OSI network model.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config) #
```

Table 111 — Global configuration mode commands

| Command                                               | Value/Default value | Action                                                                                                                                                                                                                                             |
|-------------------------------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip igmp snooping multicast-vlan enable                | -/off               | Enable the group filtering function.                                                                                                                                                                                                               |
| ip igmp snooping multicast-vlan disable               |                     | Turn off the group filtering function.                                                                                                                                                                                                             |
| snooping multicast-forwarding-mode ip                 | -/mac               | Configure the mode of multicast traffic processing by IP address.<br> <b>In this mode, part of the multicast traffic is intercepted by the device on the CPU.</b> |
| snooping multicast-forwarding-mode mac                |                     | Configure the mode of multicast traffic processing by MAC address.                                                                                                                                                                                 |
| snooping leave-process config-level port              | -/vlan              | Specify the configuration level of the release processing mechanisms (VLAN-based or port-based configurations).                                                                                                                                    |
| snooping leave-process config-level vlan              |                     | Set the default value.                                                                                                                                                                                                                             |
| snooping report-process config-level all-ports        | -/non-router-ports  | Specify the ports on which IGMP reports received from the host are processed. IGMP report can be processed on all ports or on ports that are not mrouter ports.                                                                                    |
| snooping report-process config-level non-router-ports |                     | Set the default value.                                                                                                                                                                                                                             |

### 4.16.3 MLD snooping is a protocol for multicast traffic monitoring in IPv6

MLD snooping is a multicast messaging mechanism that allows multicast traffic minimization in IPv6 networks.

**The current version of the software is not supported on MES2448B, MES2411X, MES3710P.**

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config) #
```

Table 112 — Global configuration mode commands

| Command                                         | Value/Default value | Action                                                                                                                                                  |
|-------------------------------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 mld snooping                               | -/off               | Enable MLD snooping.                                                                                                                                    |
| no ipv6 mld snooping                            |                     | Disable MLD snooping.                                                                                                                                   |
| ipv6 mld snooping group-query-interval interval | interval: (2..5)/2  | Set the timeout after which the system sends the main queries.                                                                                          |
| no ipv6 mld snooping group-query-interval       |                     | Set the default value.                                                                                                                                  |
| ipv6 mld snooping mrouter-time-out time         | time: (60..600)     | Set the timeout for clearing the port of the MLD tracking router, after which the port is deleted if no control packets are received by the MLD router. |

|                                                               |                              |                                                                                                                                                                             |
|---------------------------------------------------------------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no ipv6 mld snooping mrouter-time-out                         |                              | Set the default value.                                                                                                                                                      |
| ipv6 mld snooping port-purge-interval <i>interval</i>         | interval:<br>(130..1225)/260 | Set the time interval for clearing the MLD tracking port, after which the port is deleted if no MLD reports are received.                                                   |
| no ipv6 mld snooping port-purge-interval                      |                              | Set the default value.                                                                                                                                                      |

### VLAN configuration mode commands (range of VLANs)

```
console# configure terminal
console(config)# vlan 1,3,7
console(config-vlan-range)#
```

Table 113 — VLAN configuration mode commands

| <b>Command</b>                                                                                                                                                                                 | <b>Value/Default value</b>                                                              | <b>Action</b>                                                                                                       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| ipv6 mld snooping mrouter {<br>fastethernet <i>fa_port</i>  <br>gigabitethernet <i>gi_port</i>  <br>twopointfivegigabitethernet<br><i>two_port</i>   tengigabitethernet<br><i>te_port</i> }    | fa_port: (0/1..24);<br>gi_port: (0/1..48);<br>two_port: (0/1..8);<br>te_port: (0/1..11) | Bind the port of the MLD tracking router to the VLAN.                                                               |
| No ipv6 mld snooping mrouter<br>{ fastethernet <i>fa_port</i>  <br>gigabitethernet <i>gi_port</i>  <br>twopointfivegigabitethernet<br><i>two_port</i>   tengigabitethernet<br><i>te_port</i> } |                                                                                         | Remove the port of the MLD tracking router from the VLAN.                                                           |
| ipv6 mld snooping version {v1<br>  v2}                                                                                                                                                         | -/v2                                                                                    | Configure the MLD tracking version in the VLAN.<br>- v1 — MLD snooping Version 1;<br>- v2 — MLD snooping Version 2. |
| ipv6 mld snooping version                                                                                                                                                                      |                                                                                         | Set the default value.                                                                                              |

## EXEC mode commands

All commands are available for privileged users only.

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 114 — EXEC mode commands

| <b>Command</b>                                       | <b>Value/Default value</b> | <b>Action</b>                                                           |
|------------------------------------------------------|----------------------------|-------------------------------------------------------------------------|
| <b>show ipv6 mld snooping global</b>                 | -                          | Show the global MLD settings.                                           |
| <b>show ipv6 mld snooping vlan</b><br><i>vlan_id</i> | -                          | Show information about the MLD-snooping configuration for a given VLAN. |

### **4.16.4 Multicast traffic restriction functions**

The multicast traffic restriction functions are used to conveniently configure the restriction of viewing certain multicast groups.

## Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 115 — Global configuration mode commands

| <b>Command</b>                                        | <b>Value/Default value</b>                                  | <b>Action</b>                                                    |
|-------------------------------------------------------|-------------------------------------------------------------|------------------------------------------------------------------|
| <b>ip mcast profile index</b><br><i>[description]</i> | index: (1..4294967295);<br>description: (1..128) characters | Create a multicast profile and switch to its configuration mode. |
| <b>no ip mcast profile index</b>                      |                                                             | Delete the multicast profile.                                    |

## Multicast profile configuration mode commands

Command line prompt in the multicast configuration mode is as follows:

```
console(config-profile)#
```

Table 116 — Multicast profile configuration mode commands

| <b>Command</b>                                         | <b>Value/Default value</b> | <b>Description</b>                                                                                                                    |
|--------------------------------------------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>range first_group_ip</b><br><i>last_group_ip</i>    | -                          | Set a range of multicast traffic source addresses. If only one address is specified, it will become the only source of the multicast. |
| <b>no range first_group_ip</b><br><i>last_group_ip</i> |                            | Delete a range of multicast traffic source addresses.                                                                                 |
| <b>permit</b>                                          | -/deny                     | IGMP reports will be skipped if a profile does not match one of the specified ranges.                                                 |
| <b>deny</b>                                            |                            | IGMP reports will be dropped if a profile does not match one of the specified ranges.                                                 |
| <b>profile active</b>                                  | -                          | Enable the profile operation.                                                                                                         |
| <b>no profile active</b>                               |                            | Disable the profile operation.                                                                                                        |

## VLAN configuration mode commands

Command line prompt in the VLAN configuration mode is as follows:

```
console(config-vlan)#
```

Table 117 — VLAN configuration mode commands

| Command                                                       | Value/Default value     | Description                             |
|---------------------------------------------------------------|-------------------------|-----------------------------------------|
| <b>ip igmp snooping multicast-vlan profile</b> <i>profile</i> | index: (1.. 4294967295) | Bind the specified profile to the VLAN. |

#### 4.16.5 IGMP proxy configuration

The IGMP Proxy multicast routing function is designed for simplified routing of multicast data between IGMP managed networks. With the help of IGMP Proxy devices that are not in the same network with the multicast server can connect to multicast groups.

Routing is performed between the uplink interface and the downlink interfaces. At the same time, on the uplink-interface the switch acts as an ordinary recipient of multicast traffic (multicast client) and generates its own IGMP messages. On downlink interfaces, the switch acts as a multicast server and processes IGMP messages from devices connected to these interfaces.

The function is supported only for MES2424, MES2424B, MES2424FB, MES2424P, MES2410-08DP, MES2410-08DU, MES2448, MES2448B, MES2448P, MES2411X, MES3400-24, MES3400I-24, MES3400-24F, MES3400-48, MES3400-48F, MES3710P models.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 118 — Global configuration mode commands

| Command                         | Value/Default value | Action                                    |
|---------------------------------|---------------------|-------------------------------------------|
| <b>set ip igmp enable</b>       | -/off               | Enable the IGMP module globally.          |
| <b>set ip igmp disable</b>      |                     | Disable the IGMP module globally.         |
| <b>ip igmp proxy-service</b>    | -/off               | Enable the IGMP proxy function globally.  |
| <b>no ip igmp proxy-service</b> |                     | Disable the IGMP proxy function globally. |

#### VLAN interface configuration mode commands

Command line prompt in the VLAN interface configuration mode is as follows:

```
console(config-if)#
```

Table 119 — VLAN interface configuration mode commands

| Command                                              | Value/Default value     | Action                                                                                                                                                                                                                                                    |
|------------------------------------------------------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>set ip igmp enable</b>                            | -/off                   | Enable the IGMP module on the interface. The interface gets the Downstream role for the IGMP proxy function.                                                                                                                                              |
| <b>set ip igmp disable</b>                           |                         | Disable the IGMP module on the interface.                                                                                                                                                                                                                 |
| <b>ip igmp-proxy mrouter</b>                         | -/off                   | Specify the Upstream role for the IGMP proxy interface.                                                                                                                                                                                                   |
| <b>no ip igmp-proxy mrouter</b>                      |                         | Remove the Upstream role from the interface.                                                                                                                                                                                                              |
| <b>ip igmp-proxy mrouter-version</b> <i>version</i>  | version (1..3)/3        | Install the IGMP version on the Upstream interface.                                                                                                                                                                                                       |
| <b>ip igmp-proxy mrouter-time-out</b> <i>timeout</i> | timeout (60...600)s/125 | Set the mrouter purge timer, after which the IGMP version on the Upstream interface will change to the version configured by the ip igmp-proxy mrouter-version command. The timer restarts each time after receiving the Query on the Upstream interface. |
| <b>ip igmp immediate-leave</b>                       | -/off                   | Enable the IGMP fast-leave function on the Downstream interface.                                                                                                                                                                                          |
| <b>no ip igmp immediate-leave</b>                    |                         | Disable the IGMP fast-leave function on the Downstream interface.                                                                                                                                                                                         |

|                                                        |                             |                                                                                                                              |
|--------------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>ip igmp explicit-tracking</b>                       | -/off                       | Enable the customer tracking feature to quickly delete subscriptions when receiving IGMP leave on the Downstream interface.  |
| <b>no ip igmp explicit-tracking</b>                    |                             | Disable the customer tracking feature to quickly delete subscriptions when receiving IGMP leave on the Downstream interface. |
| <b>ip igmp query-interval</b> <i>interval</i>          | interval (30...31744)s/125s | Set the interval for sending IGMP General Query on the Downstream interface.                                                 |
| <b>no ip igmp query-interval</b>                       |                             | Reset the IGMP General Query sending interval on the Downstream interface to default.                                        |
| <b>ip igmp last-member-query-interval</b> <i>value</i> | value (1-255 )ms/10 ms      | Set the value of last-member-query-interval in IGMP group specific query messages in ms.                                     |
| <b>no ip igmp last-member-query-interval</b>           |                             | Reset the last-member-query-interval value in IGMP group specific query messages to default.                                 |
| <b>ip igmp query-max-response-time</b> <i>value</i>    | value (1-255) ms/100 ms     | Set the max-response-time value in the IGMP general query settings.                                                          |
| <b>no ip igmp query-max-response-time</b>              |                             | Reset the default value of max-response-time in IGMP general query messages to default.                                      |
| <b>ip igmp robustness</b> <i>robustness</i>            | robustness (2..7)/2         | Set the value of the IGMP robustness parameter.                                                                              |
| <b>no ip igmp robustness</b>                           |                             | Reset the default IGMP robustness value to default.                                                                          |

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 120 — Privileged EXEC mode commands

| <b>Command</b>                                                                                                         | <b>Value/Default value</b>                                                              | <b>Action</b>                                                                            |
|------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| <b>show ip igmp-proxy mrouter</b> [vlan <i>vlan-id</i> ]                                                               | vlan-id: (1..4094)/-                                                                    | Viewing information about Uplink interfaces.                                             |
| <b>show ip igmp-proxy forwarding-database</b> [vlan <i>vlan-id</i>   group <i>group-ip</i>   source <i>source-ip</i> ] | vlan-id: (1..4094)<br>group-ip: multicast ip-address<br>source-ip: unicast ip-address/- | View information about received groups and the availability of subscriptions for them.   |
| <b>show ip igmp global-config</b>                                                                                      | -/-                                                                                     | View information about the global status of the IGMP module and the IGMP proxy function. |
| <b>show ip igmp groups</b>                                                                                             | -/-                                                                                     | View information about active subscriptions to groups.                                   |
| <b>show ip igmp interface</b> [vlan <i>vlan-id</i> ]                                                                   | vlan-id: (1..4094)/-                                                                    | View information about the status of the IGMP module on the interfaces.                  |
| <b>show ip igmp statistics</b> [vlan <i>vlan-id</i> ]                                                                  | vlan-id: (1..4094)/-                                                                    | View IGMP module statistics on interfaces.                                               |

## 4.17 Management functions

### 4.17.1 AAA mechanism

To ensure system security, the switch uses AAA mechanism (Authentication, Authorization, Accounting).

- Authentication — matching the request to an existing account in the security system.
- Authorization (access level verification) — matching an existing (authenticated) account in the system to specific privileges.
- Accounting — user resource consumption monitoring.

The *SSH mechanism* is used for data encryption.

## Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 121 — Global configuration mode commands

| Command                                                                         | Value/Default value                                                          | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Terminal configuration mode commands

Command line prompt in the terminal configuration mode is as follows:

```
console# configure terminal
console(config)# line {console | telnet | ssh}
console(config-line)#
```

Table 125 — Terminal configuration mode commands

| Command                                           | Value/Default value                 | Action                                                                                             |
|---------------------------------------------------|-------------------------------------|----------------------------------------------------------------------------------------------------|
| <b>aaa authentication login</b> <i>list</i>       | list: (3..32)<br>characters/default | Set a list with login authentication methods for console, Telnet, SSH.                             |
| <b>no aaa authentication login</b>                |                                     | Set the default value.                                                                             |
| <b>aaa authentication enable</b> <i>list</i>      | list: (3..32)<br>characters/default | Set a list with authentication methods when privilege level is increased for console, Telnet, SSH. |
| <b>no aaa authentication enable</b>               |                                     | Set the default value.                                                                             |
| <b>aaa authorization command</b> {tacacs   local} | -/off                               | Allow authorization of commands for console, Telnet, SSH.                                          |
| <b>no aaa authorization command</b>               |                                     | Set the default value.                                                                             |

## 4.17.2 RADIUS

RADIUS is used for authentication, authorization and accounting. RADIUS server uses a user database that contains authentication data for each user. Thus, RADIUS provides more secure access to network resources and the switch itself.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 126 — Global configuration mode commands

| Command                                                                                                                                           | Value/Default value                                                                                                                                                              | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>radius-server host</b> {ipv4-address   ipv6-address   hostname} [timeout timeout] [retransmit retries] [key secret_key] [primary] [usage type] | hostname: (1..158)<br>characters;<br>(0..65535)/1813;<br>timeout: (1..30) sec;<br>retries: (1..15);<br>secret_key: (0..128)<br>characters;<br>type: (dot1x, enable, igmp, login) | Add the specified server to the list of used RADIUS servers.<br>- <b>ip_address</b> — RADIUS server IPv4 or IPv6 address;<br>- <b>hostname</b> — RADIUS server network name;<br>- <b>timeout</b> — server response timeout;<br>- <b>retries</b> — number of attempts to search for the RADIUS server;<br>- <b>secret_key</b> — authentication and encryption key for RADIUS data exchange;<br>- <b>primary</b> — define this RADIUS server as the highest priority;<br>- <b>usage</b> — the type of the RADIUS server usage.<br>If the timeout and retries parameters are missing in the command, the default values are used for this RADIUS server. |
| <b>no radius-server host</b> {ipv4-address   ipv6-address   hostname}                                                                             |                                                                                                                                                                                  | Remove the specified server from the list of used RADIUS servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 127 — Privileged EXEC mode commands

| <b>Command</b>                | <b>Value/Default value</b> | <b>Action</b>                                                                                             |
|-------------------------------|----------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>show radius server</b>     | -                          | Show the configuration parameters of RADIUS servers (the command is available only for privileged users). |
| <b>show radius statistics</b> | -                          | Show RADIUS protocol statistics, user information, and RADIUS server configuration.                       |

### 4.17.3 TACACS+

The TACACS+ protocol provides a centralized security system that handles user authentication and maintains compatibility with RADIUS and other authentication mechanisms. TACACS+ provides the following services:

- *Authentication.* It is provided during login by user names and user-defined passwords.
- *Authorization.* It is provided during login. After the authentication session ends, an authorization session is started using a verified user name, and user privileges are also checked by the server.

## Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 128 — Global configuration mode commands

| <b>Command</b>                                                                                                                                               | <b>Value/Default value</b>                                                                                              | <b>Action</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tacacs-server host</b><br><b>{ip_address   hostname}</b><br><b>[single-connection] [port port]</b><br><b>[timeout timeout] [key</b><br><b>secret_key]</b> | hostname: (1..63)<br>characters;<br>port: (0..65535)/49;<br>timeout: (1..30) sec;<br>secret_key: (0..128)<br>characters | Add the specified server to the list of used TACACS servers.<br>- <i>ip_address</i> — TACACS server IP address;<br>- <i>hostname</i> — TACACS server network name;<br>- <b>single-connection</b> — limit the number of connections for data exchange with the TACACS server to one at a time;<br>- <i>port</i> — the port number for data exchange with the TACACS server;<br>- <i>timeout</i> — server response timeout;<br>- <i>secret_key</i> — authentication and encryption key for TACACS data exchange;<br>When configuring the “ <b>tacacs-server host ip_address key secret_key</b> ” server, accounting is automatically enabled. |
| <b>no tacacs-server host</b><br><b>{ip_address   hostname}</b>                                                                                               |                                                                                                                         | Remove the specified server from the list of used TACACS servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>tacacs-server retransmit</b><br><b>number</b>                                                                                                             | number: (1..5)/2                                                                                                        | Specify the number of active TACACS servers to which the client will alternately connect in case of failed authentication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 129 — Privileged EXEC mode commands

| <b>Command</b>     | <b>Value/Default value</b> | <b>Action</b>                                                                                                                         |
|--------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>show tacacs</b> | -                          | Show the TACACS server settings, authentication method, and protocol statistics (the command is available only for privileged users). |

### **4.17.4 ACLs for device management**

ISS supports control traffic filtering using a list of IP Authorized Managers. In the filter, you can specify the source address or subnet, VLAN, interface and service from which device management will be allowed.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console (config) #
```

Table 130 — Global configuration mode commands

| <b>Command</b>                                                                                                                                                                            | <b>Value/Default value</b>                                           | <b>Action</b>                                            |

| <b>authorized-manager ip-source {ipv4_addr [mask   / ipv4_prefix]   ipv6_addr [ipv6_prefix]} [interface interface_list] [vlan vlan_list] [service snmp   telnet   http   https   ssh]</b> | ipv4_prefix: (0..32);<br>ipv6_prefix: (1..128)<br>vlan_id: (1..4094) | Restrict device management by a specified access filter. |
| <b>no authorized-manager ip-source {ipv4_addr [mask   / ipv4_prefix]   ipv6_addr [ipv6_prefix]}</b>                                                                                       |                                                                      | Cancel the restriction on device management.             |

**A maximum of 100 rules can be configured on the device. By default, if no rules are set, device management is available from any source.**

**After specifying at least one authorized-manager rule, the deny any any rule will be applied to all devices that are excluded by the rule.**

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 131 — Privileged EXEC mode commands

| <b>Command</b>                                              | <b>Value/Default value</b> | <b>Action</b>                     |
|-------------------------------------------------------------|----------------------------|-----------------------------------|
| <b>show authorized-managers</b> [ip-source <i>ip_addr</i> ] | -                          | Show access lists for management. |

### 4.17.5 Configuring management protocols

#### 4.17.5.1 Telnet, SSH

These commands are used to configure access servers that manage switches. TELNET and SSH support allows remote connection to the switch for monitoring and configuration purposes. Device configuration via Telnet is enabled by default.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config) #
```

Table 132 — Global configuration mode commands

| <b>Command</b>                                                                                                                | <b>Value/Default value</b> | <b>Action</b>                                                                   |

| <b>crypto key generate rsa</b>                                                                                                | -                          | Generate an RSA key pair (private and public) for SSH service.                  |
| <b>feature telnet</b>                                                                                                         | -/enabled                  | Allow configuration of the device via Telnet.                                   |
| <b>no feature telnet</b>                                                                                                      |                            | Prohibit configuration of the device via Telnet.                                |
| <b>ip ssh authorized-key</b>                                                                                                  | -                          | Set an ssh authorization key that can be used to establish a secure connection. |
| <b>no ip ssh authorized-key</b>                                                                                               |                            | Delete the ssh authorization key.                                               |
| <b>ip ssh auth-type</b> {password   publickey}                                                                                | - /password                | Set the sequence of ssh authentication methods.                                 |
| <b>no ip ssh auth-type</b>                                                                                                    |                            | Set the default value.                                                          |

#### EXEC mode commands

Commands from this section are available to privileged users only.

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 133 — EXEC mode commands

| <b>Command</b>                   | <b>Value/Default value</b> | <b>Action</b>                                                               |
|----------------------------------|----------------------------|-----------------------------------------------------------------------------|
| <b>show ip ssh</b>               | -                          | Show the SSH server configuration, as well as active incoming SSH sessions. |
| <b>show telnet server</b>        | -                          | Show the status of the Telnet server.                                       |
| <b>sh ip ssh authorized-keys</b> | -                          | Show the configured keys.                                                   |

#### 4.17.5.2 Configuring SNMP settings for accessing the device

SNMP is a technology designed to manage and control devices and applications in a communication network by exchanging management data between agents on network devices and managers on management stations. SNMP defines a network as a collection of network management stations and network elements (host machines, gateways and routers, terminal servers) that together provide administrative communications between network management stations and network agents.

Switches allow configuring SNMP for device remote monitoring and management. The device supports SNMPv1, SNMPv2 and SNMPv3.

To enable device administration via SNMP, you have to create at least one community string.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 134 — Global configuration mode commands

| <b>Command</b>                                                                                                                                          | <b>Value/Default value</b>                                                | <b>Action</b>                                                                                                                                                                                                                                                                                                                                               |

#### 4.17.5.3 Terminal configuration commands

Terminal configuration commands are used to configure terminal operation parameters.

##### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 135 — Global configuration mode commands

| <b>Command</b>      | <b>Value/Default value</b> | <b>Action</b>                                    |
|---------------------|----------------------------|--------------------------------------------------|
| <b>line console</b> | -                          | Entering the mode of the corresponding terminal. |
| <b>line telnet</b>  | -                          | Entering the mode of the corresponding terminal. |
| <b>line ssh</b>     | -                          | Entering the mode of the corresponding terminal. |

##### Terminal configuration mode commands

Command line prompt in the terminal configuration mode is as follows:

```
console# configure terminal
console(config)# line {console | telnet | ssh}
console(config-line)#
```

Table 136 — Terminal configuration mode commands

| <b>Command</b>                                              | <b>Value/Default value</b>                             | <b>Action</b>                                                                                                                                     |
|-------------------------------------------------------------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>exec-timeout seconds</b>                                 | seconds:<br>(1..18000)/1800 s                          | Set the interval during which the system waits for user input. If the user does not input anything during this interval, the console is disabled. |
| <b>no exec-timeout</b>                                      |                                                        | Set the default value.                                                                                                                            |
| <b>speed {4800   9600   19200   38400   57600   115200}</b> | (4800, 9600, 19200, 38400, 57600, 115200)/115200 bit/c | Set the transfer rate for the serial interface.                                                                                                   |

##### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 137 — EXEC mode commands

| <b>Command</b>                        | <b>Value/Default value</b> | <b>Action</b>                                                          |
|---------------------------------------|----------------------------|------------------------------------------------------------------------|
| <b>show line exec-timeout</b>         | -                          | Show the values of the exec-timeout parameter for all terminals.       |
| <b>show line exec-timeout current</b> | -                          | Show the values of the exec-timeout parameter for the current session. |

## 4.18 Alarm log, SYSLOG protocol

System logs allow keeping a history of events that occur on the device, as well as real-time event monitoring. Eight types of events are logged: emergencies, alarms, critical and non-critical errors, warnings, notifications, informational and debugging messages.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 138 — Global configuration mode commands

| Command                                                                                                                     | Value/Default value                                                                                                                        | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Each message has its own level of importance. Table 139 shows the types of messages in descending order of importance.

Table 139 — Types of message importance

| <i>Importance level</i> | <i>Message importance level</i> | <i>Description</i>                                                                        |
|-------------------------|---------------------------------|-------------------------------------------------------------------------------------------|
| 0                       | Emergencies                     | A critical error has occurred in the system, the system may not work properly.            |
| 1                       | Alerts                          | Immediate intervention is required.                                                       |
| 2                       | Critical                        | A critical error has occurred in the system.                                              |
| 3                       | Errors                          | An error has occurred in the system.                                                      |
| 4                       | Warnings                        | Warning, non-emergency message.                                                           |
| 5                       | Notifications                   | System notification, non-emergency message.                                               |
| 6                       | Informational                   | Informational system messages.                                                            |
| 7                       | Debugging                       | Debugging messages that provide a user with information for correct system configuration. |

Example of logging-file configuration:

Let's create a local file named `sl1`, where events of importance from emergency to informational will be logged.

```
console(config)# syslog file 1 sl1
console(config)# logging-file file 1
```

Example of logging-server configuration:

Specify the address of the syslog server where messages about events with importance from emergency to informational will be sent.

```
console(config)# logging-server ipv4 192.168.1.1
```

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 140 — Privileged EXEC mode commands to view the log file

| <i>Command</i>                     | <i>Value/Default value</i> | <i>Action</i>                                                         |
|------------------------------------|----------------------------|-----------------------------------------------------------------------|
| <b>clear logs</b>                  | -                          | Delete all messages from the internal buffer.                         |
| <b>show logging-file</b>           | -                          | Display logging settings in local files.                              |
| <b>show logging file file_name</b> | file_name: (1..3)          | Show the log status, alarm and debug messages stored in the log file. |
| <b>show logging-servers</b>        | -                          | Show settings for remote logging servers.                             |

## 4.19 Port mirroring (monitoring)

The port mirroring function is used for network traffic management by forwarding copies of incoming and/or outgoing packets from one or more monitored ports to one monitoring port.

**Mirroring of any number of interfaces is possible. No loss is guaranteed if the bandwidth of the destination interface is not exceeded. When using physical loops, only one copy of the frame will be mirrored on the switch if loopback interfaces belong to the same VLAN.**

The following restrictions apply to the management port:

- A port cannot be a management and a managed one at the same time;
- There should be no IP interface for this port;

The following restrictions apply to management ports:

- A port cannot be a management and a managed one at the same time.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config) #
```

Table 141 — Global configuration mode commands

| Command                                                                                                                                                                                                                                               | Value/Default value                                                                                            | Action                                                                                                                                                                                                                                  |

In this case, the vlan itself will be removed.                                                                            |
| <b>no monitor session</b> <i>session_id</i><br><b>source remote vlan</b> <i>vlan_id</i>                                                                                                                                                               |                                                                                                                | Disable the monitoring function on the configured interface.                                                                                                                                                                            |

## EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console>
```

Table 142 — EXEC mode commands

| <b>Command</b>                                   | <b>Value/Default value</b> | <b>Action</b>                                             |
|--------------------------------------------------|----------------------------|-----------------------------------------------------------|
| <b>show monitor session</b><br><i>session_id</i> | session_id: (1..4)         | Show information about the configured monitoring session. |

## Command execution examples

```
console# configure terminal
console(config)# monitor session 2 destination interface gigabitethernet
0/1
```

Show information on management and managed ports.

```
console# show monitor session 2
```

```
Mirroring is globally Enabled.
  Session      : 2
  -----
  Source Ports
    Rx          : None
    Tx          : None
    Both        : None
  Destination Ports : Gi0/1
  Session Status  : Inactive
```

## 4.20 Physical layer diagnostic functions

Network switches contain hardware and software for physical interfaces and communication lines diagnostics. The list of tested parameters includes the following:

For electrical interfaces:

- cable length;
- the distance to the place of malfunction — breakage or short circuit.

For 1G optical interfaces:

- power supply parameters — voltage and current;
- output optical power;
- input optical power.

### 4.20.1 Copper-wire cable diagnostics

## EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 143 — Copper cable diagnostics commands

| Command                                                                                                                                                                                | Value/Default value                                                                     | Action                                                     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|------------------------------------------------------------|
| test cable-diagnostics<br>fastethernet <i>fa_port</i>  <br>gigabitethernet <i>gi_port</i>  <br>twopointfivegigabitethernet<br><i>two_port</i>   tengigabitethernet<br><i>te_port</i> ] | fa_port: (0/1..24);<br>gi_port: (0/1..48);<br>two_port: (0/1..8);<br>te_port: (0/1..11) | Perform virtual cable testing for the specified interface. |

When receiving the 'Fail to get cable test result for port Gi0/X' message. Status: 3' It is recommended to check the interface media-type and the status of the interface on the remote side.

#### 4.20.2 Power supply via Ethernet lines (PoE)

The switch models MES2408CP, MES2408IP DC1, MES2408P, MES2408PL, MES2424P, MES2428P, MES2448P, MES2410-08DP, MES2410-08DU, MES3708P, MES3710P support the power supply of devices over Ethernet in accordance with the recommendations of IEEE 802.3af (PoE) and IEEE 802.3at (PoE+). Pinout type A.

MES2408PL switches have a lower power budget, relative to others.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 144 — Global configuration mode commands

| Command         | Value/Default value | Action                                        |
|-----------------|---------------------|-----------------------------------------------|
| set poe enable  | -                   | Turn on the power supply via Ethernet lines.  |
| set poe disable |                     | Turn off the power supply via Ethernet lines. |

#### Ethernet interface (interfaces range) configuration mode commands

Command line prompt in the interface configuration mode is as follows:

```
console(config-if)#
```

Table 145 — Ethernet interface configuration mode commands

| Command                                                        | Value/Default value                      | Action                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| power inline auto                                              | -/auto                                   | Allow operating the PoE device discovery protocol on the interface and enable the power supply on it.                                                                                                                                                                                                                                                                |
| power inline never                                             |                                          | Prohibit operating the PoE device discovery protocol on the interface and disable the power supply.                                                                                                                                                                                                                                                                  |
| power inline priority {critical   high   low}                  | -/low                                    | Set the priority of the PoE interface for power management.<br>- <b>critical</b> — set the highest power priority. | <b>no ethernet-oam uni-directional detection discovery-time</b>          |                            | Set the default value.                                                                                                                                                                                                              |
| <b>ethernet-oam uni-directional detection action {errdisable   log}</b>  | -/log                      | Select the mode of the UDLD protocol operation.<br>- <b>errdisable</b> — traffic transmission is blocked if there is no reception in one of the channel directions;<br>- <b>log</b> — a message about the block appears in the log. |
| <b>no ethernet-oam uni-directional detection action</b>                  |                            | Set the default value.                                                                                                                                                                                                              |

## EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console>
```

Table 148 — EXEC mode commands

| <b>Command</b>                                          | <b>Value/Default value</b> | <b>Action</b>                        |
|---------------------------------------------------------|----------------------------|--------------------------------------|
| <b>show port ethernet-oam uni-directional detection</b> | -                          | Show the status of the optical link. |

#### 4.20.4 Optical transceiver diagnostics

The diagnostic function allows to evaluate the current state of the optical transceiver and optical communication line.

It is possible to automatically control the state of communication lines. For this purpose, the switch periodically polls the parameters of the optical interfaces and compares them with the thresholds set by the transceiver manufacturers. The switch generates warning and alarm messages when parameters run out of acceptable limits.

##### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 149 — Optical transceiver diagnostic commands

| <b>Command</b>                                                                                                                                                                               | <b>Value/Default value</b> | <b>Action</b>                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|-------------------------------------------------------------|
| <b>show fiber-ports<br/>optical-transceiver [ {<br/>fastethernet fa_port  <br/>gigabitethernet gi_port  <br/>twopointfivegigabitethernet<br/>two_port   tengigabitethernet<br/>te_port}]</b> | -                          | Display the results of the optical transceiver diagnostics. |

Table 150 — Optical transceiver diagnostics parameters

| <b>Parameter</b>    | <b>Meaning</b>                     |
|---------------------|------------------------------------|
| <i>Temp</i>         | Transceiver temperature.           |
| <i>Voltage</i>      | Transceiver power supply voltage.  |
| <i>Current</i>      | Transmission current deviation.    |
| <i>Output Power</i> | Output transmission power (mW).    |
| <i>Input Power</i>  | Input power on the reception (mW). |
| <i>LOS</i>          | Signal loss.                       |

Diagnostics results:

- N/A — not available,
- N/S — not supported.

## 4.21 Security features

### 4.21.1 Port security functions

To improve security, it is possible to configure a switch port so that only specified devices can access the switch via that port. The port security function is based on specifying MAC addresses permitted to access the switch. MAC addresses can be configured manually or learned by the switch. After learning the required addresses, the port should be blocked protecting it from receiving packets with unexplored MAC addresses.

Thus, when the blocked port receives a packet and the packet's source MAC address is not associated with this port, protection mechanism will be activated to perform one of the following actions: unauthorized packets coming on the blocked port are forwarded, dropped, or the port is disabled. The *Locked Port* security function allows to save a list of learned MAC addresses in a configuration file, so that this list can be restored after the device reboots.

**There is a restriction on the number of learned MAC addresses for the port protected by the security function.**

### Ethernet or port group interface (interface range) configuration mode commands

Command line prompt in the Ethernet or port group interface configuration mode is as follows:

```
console(config-if)#
```

Table 151 — Ethernet and port group interface configuration mode commands

| <b>Command</b>                                                                                          | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------------------------------------------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>switchport port-security enable</b>                                                                  | -/off                      | Enable the IP Source Guard function on the interface. Block the function of learning new addresses for the interface. Packets with unlearned source MAC addresses are discarded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### 4.21.2 DHCP management and Option 82

DHCP (Dynamic Host Configuration Protocol) is a network protocol that allows a client to receive an IP address and other parameters required for the proper operation in TCP/IP networks upon request.

DHCP is used by hackers to attack devices from the client side, forcing DHCP server to report all available addresses, and from the server side by spoofing. The switch firmware features the DHCP snooping function that ensures device protection from attacks via DHCP.

The device discovers DHCP servers in the network and allows them to be used only via trusted interfaces. The device also controls client access to DHCP servers using a mapping table.

DHCP Option 82 is used to inform DHCP server about the DHCP Relay Agent and the port the particular request came from. It is used to establish mapping between IP addresses and switch ports and ensure protection from attacks via DHCP. Option 82 is additional information (device name, port number) added by the switch, which operates in the agent's DHCP Relay mode, in the form of a DHCP request received from the client. Based on this option, DHCP server allocates an IP address (IP address range) and other parameters to the switch port. When the necessary data is received from the server, the DHCP Relay agent provides an IP address and sends other required data to the client.

Table 152 — Option 82 field formats

| Field           | Transmitted information                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Circuit ID      | The host name of the device.<br>a string in the following format: eth <stacked/slotid/interfaceid>: <vlan><br>The last byte is the number of the port that the device sending a DHCP request is connected to. |
| Remote agent ID | Enterprise number — 0089c1<br>The device MAC address.                                                                                                                                                         |

**To ensure the correct operation of DHCP snooping, all DHCP servers used must be connected to trusted ports of the switch. To add a port to the "trusted" list, use the port-security-state trusted, set port-role uplink commands in the interface configuration mode. To ensure security, all other switch ports are required to be untrusted.**

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config) #
```

Table 153 — Global configuration mode commands

| Command                                                  | Value/Default value            | Action                                                                                                                                                                                                                     |

| <b>ip {dhcp  dhcpv6} snooping vlan <i>vlan_id</i></b>    | vlan_id:<br>(1..4094)/disabled | Allow control of the DHCP protocol within the specified VLAN.                                                                                                                                                              |
| <b>no ip {dhcp  dhcpv6} snooping vlan <i>vlan_id</i></b> |                                | Prohibit control of the DHCP protocol within the specified VLAN.                                                                                                                                                           |
| <b>ip dhcp snooping verify mac-address</b>               | -/enabled                      | Enable verification of the client's MAC address and the source MAC address received in a DHCP packet on untrusted ports.                                                                                                   |
| <b>no ip dhcp snooping verify mac-address</b>            |                                | Disable verification of the client's MAC address and the source MAC address received in the DHCP packet on "untrusted" ports.                                                                                              |
| <b>ip binding port-down action {clear retain}</b>        | -/retain                       | To determine the reaction of the switch to the interface fall:<br>- <b>retain</b> — saves entries in the table when the interface falls.<br>- <b>clear</b> — deletes all dynamic entries created for the fallen interface. |

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 154 — Privileged EXEC mode commands

| <b>Command</b>                                        | <b>Value/Default value</b> | <b>Action</b>                                                            |
|-------------------------------------------------------|----------------------------|--------------------------------------------------------------------------|
| <b>show ip {dhcp   dhcpv6} snooping</b>               | -                          | Show matches from the file (database) of the DHCP protocol control.      |
| <b>show ip dhcp snooping global</b>                   | -                          | Show global DHCP Snooping configuration.                                 |
| <b>show {ip   ipv6} binding</b>                       | -                          | Show all matches from the file (database) of the DHCP protocol control.  |
| <b>clear {ipv4   ipv6} binding [mac_addr vlan_id]</b> | vlan_id: (1..4094)         | Clear the matches from the file (database) of the DHCP protocol control. |

### Ethernet or port group interface (interface range) configuration mode commands

Command line prompt in the Ethernet or port group interface configuration mode is as follows:

```
console(config-if)#
```

Table 155 — Ethernet and port group interface configuration mode commands

| <b>Command</b>                | <b>Value/Default value</b> | <b>Action</b>                                                     |
|-------------------------------|----------------------------|-------------------------------------------------------------------|
| <b>ip binding limit limit</b> | limit (0..1024)            | Enable the limitation of the number of DHCP clients on the port.  |
| <b>no ip binding limit</b>    |                            | Disable the limitation of the number of DHCP clients on the port. |

**The established limit on the number of DHCP clients will apply only to new entries. It is recommended to clear the DHCP snooping client table before setting up the limit.**

#### **4.21.3 DSLAM Controller Solution (DCS)**

Using this function, the values of the interface and repeater identifiers are configured when configuring DHCP snooping, DHCPv6 snooping and the Intermediate Agent. Circuit-id is the identifier of the interface from which the request came, remote-id is the identifier of the repeater from which the request came.

When the function is enabled on the interface, circuit-id and remote-id will be inserted in all VLANs on which DHCPv4/v6 snooping, DHCP Relay, and PPPoE-IA are enabled. When enabled in the VLAN, the circuit-id and remote-id will be inserted only in this VLAN on all interfaces.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 156 — Global configuration mode commands

| <b>Command</b>                                                               | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                           |
|------------------------------------------------------------------------------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dcx information option [dhcp   dhcpv6   pppoe-ia   dhcp-relay] enable</b> | -/off                      | Enable adding of circuit-id + remote-id for all options (i.e. dhcp   dhcpv6   pppoe-ia   dhcp-relay) or set a specific protocol for inserting remote-id and circuit-id. |
| <b>dcx information option [dhcp   dhcpv6   pppoe-ia] disable</b>             |                            | Disable adding remote-id and circuit-id.                                                                                                                                |

|                                                                                                                                                    |                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 157 — Templates available for configuring user-defined identifiers

| <i>Pattern</i> | <i>Description</i>                                                                                                                                   |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| %a             | IP address. This template can be converted to the HEX format. It is possible to specify a VLAN number with an IP address (for example, VLAN 2: %a2). |
| %h             | The name of the device.                                                                                                                              |
| %p             | A short port name, for example, gi1/0/1.                                                                                                             |
| %P             | A long port name, for example, gigabitethernet 1/0/1.                                                                                                |
| %t             | The type of port, for example, is gigabitethernet.                                                                                                   |
| %m             | Port MAC address in the H-H-H-H-H-H format. This template can be converted to the HEX format.                                                        |
| %M             | System MAC address in the H-H-H-H-H-H format. This template can be converted to the HEX format.                                                      |
| %u             | Unit number. This template can be converted to the HEX format.                                                                                       |
| %s             | The slot number. This template can be converted to the HEX format.                                                                                   |
| %i             | ifIndex of the port. This template can be converted to the HEX format.                                                                               |
| %c             | Subscriber device MAC address in the H-H-H-H-H-H format. This template can be converted to the HEX format.                                           |
| %v             | The VLAN ID. This template can be converted to the HEX format.                                                                                       |

### Ethernet interface configuration mode commands

Command line prompt in the Ethernet interface configuration mode is as follows:

```
console (config-if) #
```

Table 158 — Ethernet interface configuration mode commands

| <i>Command</i>                                                               | <i>Value/Default value</i>                          | <i>Action</i>                                                                                                                                                                                                         |
|------------------------------------------------------------------------------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dcx agent-circuit-identifier</b><br><i>circuit_id</i>                     | circuit_id: (1..63)<br>characters/pattern<br>%h%i%v | Set the circuit-id in a user-defined format. It is possible to use templates.<br>This setting takes precedence over the similar global circuit-id format setting.                                                     |
| <b>no dcs agent-circuit-identifier</b>                                       |                                                     | Set default values.                                                                                                                                                                                                   |
| <b>dcx remote-agent-identifier</b><br><i>remote_id</i>                       | remote_id: (1..63)<br>characters/pattern %m         | Set the remote-id in a user-defined format. It is possible to use templates.<br>This setting takes precedence over the similar global setting of the remote-id format.                                                |
| <b>no dcs remote-agent-identifier</b>                                        |                                                     | Set the default value.                                                                                                                                                                                                |
| <b>dcx information option {dhcp   dhcpv6   pppoe-ia   dhcp-relay} enable</b> | -/off                                               | Enable adding circuit-id + remote-id for a specific protocol.<br> <b>Circuit-id/remote-id insertion must be disabled globally.</b> |
| <b>dcx information option {dhcp   dhcpv6   pppoe-ia} disable</b>             |                                                     | Disable adding remote-id and circuit-id for a specific protocol.                                                                                                                                                      |

### L2Vlan interface configuration mode commands

Command line prompt is as follows:

```
console (config-vlan) #
```

Table 159 — Commands of the L2Vlan interface configuration mode

| Command                                                                      | Value/Default value | Action                                                                                                                                                                                                              |
|------------------------------------------------------------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dcx information option {dhcp   dhcpv6   pppoe-ia   dhcp-relay} enable</b> | -/off               | Enable adding circuit-id + remote-id for a specific protocol.<br> <b>Circuit-id/remote-id insertion must be disabled globally.</b> |
| <b>dcx information option {dhcp   dhcpv6   pppoe-ia} disable</b>             |                     | Disable adding remote-id and circuit-id for a specific protocol.                                                                                                                                                    |

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 160 — Privileged EXEC mode commands

| Command                                                                                                                                                                                                                          | Value/Default value                                                                                                                                    | Action                                                                             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| <b>show dcs-port-config</b><br>[interface fastethernet <i>fa_port</i>  <br>gigabitethernet <i>gi_port</i>  <br>twopointfivegigabitethernet<br><i>two_port</i>   tengigabitethernet<br><i>te_port</i> ]<br>[vlan <i>vlan_id</i> ] | <i>fa_port</i> : (0/1..24);<br><i>gi_port</i> : (0/1..48);<br><i>two_port</i> : (0/1..8);<br><i>te_port</i> : (0/1..11);<br><i>vlan_id</i> : (1..4094) | Show the current configuration of the remote-id and circuit-id for the interfaces. |
| <b>show dcs-global-config</b>                                                                                                                                                                                                    | -                                                                                                                                                      | Show the global configuration of the circuit-id.                                   |

An example of configuring DHCP Snooping in VLAN10 with configuring DCS options on the Gigabitethernet 0/13 interface.

```
console(config)# interface gigabitethernet 0/10
console(config-if)# port-security-state trusted
console(config-if)# set port-role uplink
console(config-if)# switchport mode trunk
console(config-if)# exit
console(config)# ip dhcp snooping
console(config)# vlan 10
console(config-vlan)# ip dhcp snooping
console(config)# interface gigabitethernet 0/13
console(config-if)# switchport general allowed vlan add 10 untagged
console(config-if)# switchport general pvid 10
console(config-if)# dcs remote-agent-identifier enable
console(config-if)# dcs agent-circuit-identifier "%v %p %h"
console(config-if)# dcs remote-agent-identifier "%M"
```

An example of configuring DHCP Snooping in VLAN10 with configuring DCS options for all interfaces in HEX format.

```
console(config)# !
console(config)# interface gigabitethernet 0/10
console(config-if)# port-security-state trusted
console(config-if)# set port-role uplink
console(config-if)# switchport mode trunk
console(config-if)# exit
console(config)# ip dhcp snooping
console(config)# dcs remote-agent-id suboption-type dhcpv4 user-defined binary
console(config)# dcs agent-circuit-id suboption-type dhcpv4 user-defined binary
console(config)# dcs agent-circuit-id user-defined "%i%v"
console(config)# dcs remote-agent-id user-defined "%M"
console(config)# !
console(config)# vlan 10
console(config-vlan)# ip dhcp snooping
```

```
console(config-vlan)# !
console(config)# interface gigabitethernet 0/13
console(config-if)# switchport general allowed vlan add 10 untagged
console(config-if)# switchport general pvid 10
```

#### 4.21.4 IP Source Guard

The IP Source Guard function filters the traffic received from the interface based on DHCP snooping table and IP Source Guard static mappings. Thus, IP Source Guard eliminates IP address spoofing in packets.

**Given that the IP Source Guard function uses DHCP snooping mapping tables, it makes sense to use it after enabling and configuring DHCP snooping.**

#### Ethernet interface configuration mode commands

Command line prompt is as follows:

```
console(config-if)#
```

Table 161 — Ethernet interface configuration mode commands

| Command                                    | Value/Default value | Action                                                                                                                                                            |
|--------------------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {ip   ipv6} verify source port-security    | -/off               | Enable the IP interface protection function for the port. After enabling the interface, all entries in the IP Binding table are set to TCAM as a permissive rule. |
| no {ip   ipv6} verify source port-security |                     | The command deletes entries from TCAM and disables IP packet dropping on the port.                                                                                |

#### L2Vlan interface configuration mode commands

Command line prompt is as follows:

```
console(config-vlan)#
```

Table 162 — Commands of the L2Vlan interface configuration mode

| Command                                    | Value/Default value | Action                                                                                                                                                             |
|--------------------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {ip   ipv6} verify source port-security    | -/off               | Enable the IP/IPv6 interface protection function for VLAN. After enabling the interface, all entries in the IP Binding table are set to TCAM as a permissive rule. |
| no {ip   ipv6} verify source port-security |                     | The command deletes entries from TCAM and disables IP/IPv6 packet dropping in VLAN.                                                                                |

#### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 163 — Privileged EXEC mode commands

| Command                                                                                                                                                       | Value/Default value | Action                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|-----------------------------------------------------------|
| show { ip   ipv6 } verify source [interface { fastethernet   gigabitethernet   twopointfivegigabitethernet   tengigabitethernet } interface   vlan [vlan-id]] | -                   | Show the IP/IPv6 source Guard settings on the interfaces. |
| show running-config ip-source-guard                                                                                                                           | -                   | Show the IP source Guard module configuration.            |

### 4.21.5 ARP Inspection

The ARP Inspection function is designed to protect against attacks using the ARP protocol (for example, ARP-spoofing - interception of ARP traffic). ARP inspection is based on static mappings between specific IP and MAC addresses for a VLAN group.

**If a port is configured as untrusted for the ARP Inspection feature, it must also be untrusted for DHCP Snooping, and the mapping between MAC and IP addresses for this port should be configured statically. Otherwise, the port will not respond to ARP requests.**

**For untrusted ports, IP and MAC address match checks are performed.**

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config) #
```

Table 164 — Global configuration mode commands

|                                                                                                                                     | <i>Value/Default value</i>  | <i>Action</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip arp inspection enable</b>                                                                                                     | -/off                       | Enable the ARP Inspection function.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>ip arp inspection disable</b>                                                                                                    |                             | Disable the ARP Inspection function.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ip arp inspection vlan <i>vlan_id</i></b>                                                                                        | vlan_id: (1..4094)/disabled | Allow ARP Inspection based on DHCP Snooping mappings in the selected VLAN group.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>no ip arp inspection vlan <i>vlan_id</i></b>                                                                                     |                             | Prohibit ARP Inspection based on DHCP Snooping mappings in the selected VLAN group.                                                                                                                                                                                                                                                                                                                                                                                          |

#### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 165 — EXEC mode commands

| <i>Command</i>                                                                                                                                                                     | <i>Value/Default value</i> | <i>Action</i>                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show ip arp inspection globals</b>                                                                                                                                              | -                          | Show the system configuration of the ARP protocol inspection function.                                                                                             |
| <b>show ip arp inspection vlan [<i>vlan_id</i>]</b>                                                                                                                                | vlan_id: (1..4094)         | Show a list of VLANs on which ARP Inspection is active.                                                                                                            |
| <b>show ip arp inspection statistics {global   interface { fastethernet   gigabitethernet   twopointfivegigabitethernet   tengigabitethernet} interface   vlan <i>vlan_id</i>}</b> | vlan_id: (1..4094)         | Show statistics for the following types of packets that were processed using the ARP function:<br>- forwarded packets;<br>- dropped packets;<br>- IP/MAC Failures. |
| <b>clear ip arp inspection statistics [global   vlan <i>vlan_id</i>]</b>                                                                                                           | vlan_id: (1..4094)         | Clear the ARP Inspection protocol control statistics.                                                                                                              |

#### 4.21.6 Configuring MAC Address Notification function

MAC Address Notification function allows monitoring the availability of the network equipment by saving MAC address learning history. When changes in MAC addresses learning list occur, the switch saves information to the MAC table and notifies the user with SNMP protocol messages. The function has configurable parameters — the depth of the event history and the minimum interval for sending messages. The MAC Address Notification service is disabled by default and can be configured selectively for individual switch ports.

##### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 166 — Global configuration mode commands

| <b>Command</b>                                              | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mac-address-table notification change</b>                | -/off                      | The command is intended for global management of the MAC notification function. The command allows registration of events for adding and removing MAC addresses to/from switch tables and sending event notifications.<br>To ensure proper function operation, it is necessary to additionally enable generation of notifications on interfaces (see below).                                                           |
| <b>no mac-address-table notification change</b>             |                            | Disable the MAC notification function globally and cancel the corresponding settings on all interfaces.                                                                                                                                                                                                                                                                                                                |
| <b>mac-address-table notification change interval value</b> | value: (0..604800)/1       | The maximum time interval between sending SNMP notifications. If the interval value equals 0, notifications will be generated and events will be saved to the history immediately as the MAC address table state change events occur. If time interval is greater than 0 the device will collect MAC address table change events during this time and then send SNMP notifications and save the events to the history. |
| <b>no mac-address-table notification change interval</b>    |                            | Restore the default value.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>mac-address-table notification change history value</b>  | value: (0..500)/1          | Set the maximum number of events about changing the state of the MAC address table that is saved in the history. If the history value equals 0, events will not be saved. In case of history buffer overrun, the oldest event will be replaced with the newest one.                                                                                                                                                    |
| <b>no mac-address-table notification change history</b>     |                            | Restore the default value.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>logging events mac-address-table change</b>              | -/off                      | Enable sending traps about events of studying or deleting MAC addresses to the syslog.                                                                                                                                                                                                                                                                                                                                 |
| <b>no logging events mac-address-table change</b>           |                            | Disable sending traps about events of studying or deleting MAC addresses to the syslog.                                                                                                                                                                                                                                                                                                                                |
| <b>mac-address-table notification flapping</b>              | -/enabled                  | Enable MAC Flapping tracking.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>no mac-address-table notification flapping</b>           |                            | Disable MAC Flapping tracking.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>logging events mac-address-table flapping</b>            | -/enabled                  | Enable MAC Flapping logging.                                                                                                                                                                                                                                                                                                                                                                                           |

### Ethernet interface configuration mode commands

Command line prompt is as follows:

```
console(config-if) #
```

Table 167 — Ethernet interface configuration mode commands

| <b>Command</b>                                                  | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                                                             |
|-----------------------------------------------------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>snmp trap mac-address-table change [learnt   removed]</b>    | -/off                      | Enable generation of notifications about MAC address status changes on each interface.<br>- <b>learnt</b> — notifications about learning MAC addresses;<br>- <b>removed</b> — notifications about removing MAC addresses. |
| <b>no snmp trap mac-address-table change [learnt   removed]</b> |                            | Disable generation of notifications on the interface.                                                                                                                                                                     |

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 168 — Privileged EXEC mode commands

| <b>Command</b>                                            | <b>Value/Default value</b> | <b>Action</b>                                                                             |
|-----------------------------------------------------------|----------------------------|-------------------------------------------------------------------------------------------|
| <b>show mac-address-table notification change history</b> | -                          | Show all notifications about changes in the status of MAC addresses saved in the history. |
| <b>show snmp-server traps</b>                             | -                          | View the events when traps are generated.                                                 |

### **4.21.7 Port based client authentication (802.1x standard)**

Authentication based on 802.1x standard provides switch users authentication via an external server based on the port to which a client is connected. Only authenticated and authorized users will be able to send and receive data. Authentication of port users is performed by the RADIUS server via EAP (Extensible Authentication Protocol).

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config) #
```

Table 169 — Global configuration mode commands

| <b>Command</b>                      | <b>Value/Default value</b> | <b>Action</b>                                         |
|-------------------------------------|----------------------------|-------------------------------------------------------|
| <b>shutdown dot1x</b>               | -/enabled                  | Disable the dot1x module.                             |
| <b>no shutdown dot1x</b>            |                            | Enable the dot1x module.                              |
| <b>dot1x system-auth-control</b>    | -/off                      | Enable the 802.1x authentication mode on the switch.  |
| <b>no dot1x system-auth-control</b> |                            | Disable the 802.1x authentication mode on the switch. |

## Ethernet interface configuration mode commands

Command line prompt in the Ethernet interface configuration mode is as follows:

```
console (config-if) #
```

Table 170 — Ethernet interface configuration mode commands

| Command                                                                  | Value/Default value               | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------------------------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dot1x host-mode</b> {multi-host   multi-session}                      | -/multi-host                      | Allow multiple clients on an authorized dot1x port:<br>- <b>multi-host</b> — multiple clients;<br>- <b>multi-session</b> — multiple sessions.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>dot1x max-req</b> number                                              | number: (1..10)/2                 | Set the maximum number of attempts to transmit EAP protocol requests to the client before starting the authentication process again.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>no dot1x max-req</b>                                                  |                                   | Set the default value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>dot1x port-control</b> {auto   force-authorized   force-unauthorized} | -/force-authorized                | Configure 802.1X authentication on the interface. Allow manual monitoring of the port authorization status.<br>- <b>auto</b> — use 802.1X to switch the client state between authorized and unauthorized;<br>- <b>force-authorized</b> — disable 802.1X authentication on the interface. The port switches to an authorized state without authentication;<br>- <b>force-unauthorized</b> — switch the port to an unauthorized state. All client authentication attempts are ignored, and the switch does not provide an authentication service for this port. |

### Example of enabling 802.1x authentication mode on a switch

Use a RADIUS server to authenticate clients on IEEE 802.1x interfaces. For the 8 Ethernet interface, use the 802.1x authentication mode.

```
console# configure terminal
console(config)# dot1x system-auth-control
console(config)# aaa authentication dot1x default group radius
console(config)# interface gigabitethernet 0/8
console(config-if)# dot1x port-control auto
```

### 4.21.8 Configuring the IPv6 RA Guard function

The IPv6 RA Guard feature provides protection against attacks based on sending fake Router Advertisement packets, allowing messages to be sent only from trusted ports.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 172 — Global configuration mode commands

| Command                                                                                | Value/Default value                           | Action                                                                                                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| show ipv6 nd ra-guard policy<br>[ <i>policy_id</i> ]                                                                                                                                                                         | policy_id: (1..65535) | Show the IPv6 RA Guard policy settings.    |
| show ipv6 nd ra-guard global                                                                                                                                                                                                 | -                     | Show the IPv6 RA Guard global settings.    |

#### 4.21.9 Configuring the IPv6 ND Inspection function

The IPv6 ND Inspection function provides protection against attacks based on sending fake Neighbor Advertisement, allowing messages to be sent only from trusted ports or if the package complies with a configured policy.

##### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 176 — Global configuration mode commands

| Command                                                                                | Value/Default value                               | Action                                                                                                                                                                                                                                                                                                                          |

##### Policy IPv6 ND Inspection configuration mode commands

Command line prompt in the policy IPv6 ND Inspection configuration mode:

```
console(config-ndi)#
```

Table 177 — Policy IPv6 ND Inspection configuration mode commands

| Command                                 | Value/Default value | Action                                                    |
|-----------------------------------------|---------------------|-----------------------------------------------------------|
| <b>override-flag {on   off   none}</b>  | -/none              | Specify the override flag value in NA messages.           |
| <b>router-flag {on   off   none}</b>    | -/none              | Determine the value of the router flag in NA messages.    |
| <b>solicited-flag {on   off   none}</b> | -/none              | Determine the value of the solicited flag in NA messages. |

|                                                      |                                        |                                                                          |
|------------------------------------------------------|----------------------------------------|--------------------------------------------------------------------------|
| <b>match src-addr-acl</b> <i>src-addr-acl_num</i>    | <i>src-addr-acl_num:</i><br>(1..65535) | Bind <b>src-addr-acl</b> to the policy IPv6 ND Inspection.               |
| <b>no match src-addr-acl</b> <i>src-addr-acl_num</i> |                                        | Remove the <b>src-addr-acl</b> binding to the policy IPv6 ND Inspection. |
| <b>match tgt-addr-acl</b> <i>tgt-addr-acl_num</i>    | <i>tgt-addr-acl_num:</i><br>(1..65535) | Bind <b>tgt-addr-acl</b> to the policy IPv6 ND Inspection.               |
| <b>no match tgt-addr-acl</b> <i>tgt-addr-acl_num</i> |                                        | Remove the <b>tgt-addr-acl</b> binding to the policy IPv6 ND Inspection. |
| <b>match tgt-mac-acl</b> <i>tgt-mac-acl_num</i>      | <i>tgt-mac-acl_num:</i><br>(1..65535)  | Bind <b>tgt-mac-acl</b> to the policy IPv6 ND Inspection.                |
| <b>no match tgt-mac-acl</b> <i>tgt-mac-list_num</i>  |                                        | Remove the <b>tgt-mac-acl</b> binding to the policy IPv6 ND Inspection.  |

### Ethernet interface configuration mode commands

Command line prompt in the Ethernet interface configuration mode is as follows:

```
console (config-if) #
```

Table 178 — Ethernet interface configuration mode commands

| <b>Command</b>                                              | <b>Value/Default value</b>          | <b>Action</b>                                                   |
|-------------------------------------------------------------|-------------------------------------|-----------------------------------------------------------------|
| <b>ipv6 nd inspection</b>                                   | -/off                               | Enable the IPv6 ND Inspection function on the interface.        |
| <b>no ipv6 nd inspection</b>                                |                                     | Disable the IPv6 ND Inspection function on the interface.       |
| <b>ipv6 nd inspection trust-state trusted</b>               | By default, all ports are untrusted | Add the port to the trusted list.                               |
| <b>ipv6 nd inspection trust-state untrusted</b>             |                                     | Remove the port from the trusted list.                          |
| <b>ipv6 nd inspection attach-policy</b> <i>policy_id</i>    | <i>policy_id:</i> (1..65535)        | Bind the configured IPv6 ND Inspection policy to the interface. |
| <b>no ipv6 nd inspection attach-policy</b> <i>policy_id</i> |                                     | Remove the policy IPv6 ND Inspection <b>from</b> the interface. |

**The policy cannot be bound to an interface that is in the list of trusted ports.**

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 179 — Privileged EXEC mode commands

| <b>Command</b>                                                                                                                                                                                                                                                | <b>Value/Default value</b>             | <b>Action</b>                                         |

## 4.22 DHCP Relay Agent functions

The switches support the functions of DHCP Relay Agent. The purpose of the DHCP Relay Agent is to transfer DHCP packets from the client to the server and back if the DHCP server is on one network and the client is on another. Another function is to add additional options to the client's DHCP requests (for example, Option 82).

The principle of the DHCP Relay Agent operation on the switch: the switch accepts DHCP requests from the client, transmits these requests to the server on behalf of the client (leaving options with the parameters required by the client in the request and, depending on the configuration, adding its own options). After receiving a response from the server, the switch transmits it to the client.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 180 — Global configuration mode commands

| Command                                                                              | Value/Default value                                                                      | Action                                                                        |
|--------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| ip dhcp relay                                                                        | -/off                                                                                    | Enable the DHCP Relay agent function on the switch.                           |
| no ip dhcp relay                                                                     |                                                                                          | Disable the DHCP Relay agent function on the switch.                          |
| ip dhcp relay server ip_add<br>[source-port src_port]<br>[destination-port dst_port] | src_port: (1..65535);<br>dst_port: (1..65535);<br>Up to five servers can<br>be specified | Set the IP address of the available DHCP server for the DHCP Relay agent.     |
| no ip dhcp relay server ip_add                                                       |                                                                                          | Remove the IP address from the list of DHCP servers for the DHCP Relay agent. |

### VLAN configuration mode commands

Command line prompt in the VLAN configuration mode is as follows:

```
console(config-vlan)#
```

Table 181 — VLAN configuration mode commands

| Command          | Value/Default value | Action                                                         |
|------------------|---------------------|----------------------------------------------------------------|
| ip dhcp relay    | -/off               | Enable the DHCP Relay agent function for the configured VLAN.  |
| no ip dhcp relay |                     | Disable the DHCP Relay agent function for the configured VLAN. |

## EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 182 — EXEC mode commands

| <b>Command</b>                                                                                                                                                                                                  | <b>Value/Default value</b>                                                          | <b>Action</b>                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>show ip dhcp relay information</b><br>{fastethernet <i>fa_port</i>   giga-bitethernet <i>gi_port</i>   two-pointfivegigabitethernet <i>two_port</i>   tengigabitethernet <i>te_port</i>   vlan <i>vlan</i> } | fa_port: (0/1..24);<br>gi_port: (0/1..28);<br>te_port: (0/1..6);<br>vlan: (1..4094) | Show the DHCP Relay Agent function configuration and a list of available servers for the switch and separately for the interfaces. |
| <b>show dhcp server</b>                                                                                                                                                                                         | -                                                                                   | Show the list of available servers.                                                                                                |

## 4.23 DHCP server configuration

The function is supported only for MES2424, MES2424B, MES2424FB, MES2424P, MES2410-08DP, MES2410-08DU, MES2448, MES2448B, MES2448P, MES2420-48P, MES2420B-24D, MES2411X, MES3400-24, MES3400I-24, MES3400-24F, MES3400-48, MES3400-48F, MES3710P.

DHCP server performs centralized management of network addresses and corresponding configuration parameters, and automatically provides them to subscribers. This avoids manual configuration of network devices and reduces the number of errors.

Ethernet switches can work as a DHCP client (getting their own IP address from a DHCP server), or as a DHCP server. If the DHCP server is disabled, the switch can work with DHCP Relay.

Configuration of the DHCP server options is possible both from the global configuration mode and from the DHCP address pool configuration mode. In the configuration mode of the DHCP address pool, it is possible to configure static entries.

If the values of the DHCP server options are configured simultaneously in global configuration mode, in the DHCP address pool configuration mode and in the host entry configuration mode, the options will be issued in accordance with the following priority:

1. Setting up static entry.
2. Setting up for pool.
3. Global setting.

## Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 183 — Global configuration mode commands

| <b>Command</b>           | <b>Value/Default value</b> | <b>Action</b>                                   |
|--------------------------|----------------------------|-------------------------------------------------|
| <b>ip dhcp server</b>    | -/off                      | Enable the DHCP server function on the switch.  |
| <b>no ip dhcp server</b> |                            | Disable the DHCP server function on the switch. |

|                                                                                       |                                                          |                                                                                                                                                                                                                                                                                                                                                        |

### DHCP server pool configuration mode commands

Command line prompt in the DHCP server pool configuration mode is as follows:

```
console# configure
console(config)# ip dhcp pool 1 test
console(config-dhcp)#
```

Table 184 — Configuration mode commands

| <b>Command</b>                                                                                                          | <b>Value/Default value</b>                           | <b>Action</b>                                                                                                                                                                                                                                                                                                                             |

### Example use of commands

Configure a DHCP pool named test and specify for DHCP clients: domain name — test.ru , the default gateway — 192.168.45.1 and the DNS server — 192.168.45.112.

```

console#
console# configure terminal
console(config)# interface vlan 1
console(config-if)# ip address 192.168.45.1 255.255.255.0
console(config-if)# exit
console(config)# ip dhcp server
console(config)# ip dhcp pool 1 test
console(dhcp-config)# network 192.168.45.0 255.255.255.0
console(dhcp-config)# domain-name test.ru
console(dhcp-config)# dns-server 192.168.45.112
console(dhcp-config)# default-router 192.168.45.1
console(dhcp-config)# host hardware-address aa:bb:cc:dd:ee:ff ip
192.168.45.250

```

```
console(dhcp-config)# host hardware-address aa:bb:cc:dd:ee:ff ntp-server
192.168.45.254
console(dhcp-config)# host hardware-address aa:bb:cc:dd:ee:ff dns-server
192.168.45.113
```

### Examples of setting options

Configure a DHCP pool named test and specify the following options for DHCP clients: option 3 — 192.168.45.1, option 12 — hostname\_test, option 15 — test.ru, option 19 — True.

```
console#
console# configure terminal
console(config)# interface vlan 1
console(config-if)# ip address 192.168.45.1 255.255.255.0
console(config-if)# exit
console(config)# ip dhcp server
console(config)# ip dhcp pool 1 test
console(dhcp-config)# network 192.168.45.0 255.255.255.0
console(dhcp-config)# option 3 ip 192.168.45.1
console(dhcp-config)# option 12 hex 686f73746e616d655f74657374
console(dhcp-config)# option 15 ascii test.ru
console(dhcp-config)# option 19 boolean
```

In the example, the value of option 12 is converted from ascii to hex.

### Commands of the static address configuration mode of the DHCP server

Command line prompt in the DHCP server pool configuration mode is as follows:

```
console# configure
console(config)# ip dhcp pool 1 test
console(config-dhcp)#
```

Table 185 — Global configuration mode commands

| Command                                                                               | Value/Default value                                      | Action                                                                                                                                                                                                                                                                                                                                                                                                                        |

**When specifying the Client ID in ASCII format, make sure that the DHCP client sends the Client ID with the Hardware Type in the first byte corresponding to the specified format.**

### Example of setting up a static entry

Assign to the device with the MAC address aa:bb:cc:dd:ee:ff ip address 192.168.45.250, time server 192.168.45.254 and DNS server 192.168.45.113

```

console#
console# configure terminal
console(config)# interface vlan 1
console(config-if)# ip address 192.168.45.1 255.255.255.0
console(config-if)# exit
console(config)# ip dhcp server
console(config)# ip dhcp pool 1 test
console(dhcp-config)# network 192.168.45.0 255.255.255.0
console(dhcp-config)# host hardware-address aa:bb:cc:dd:ee:ff ip 192.168.45.250
console(dhcp-config)# host hardware-address aa:bb:cc:dd:ee:ff ntp-server 192.168.45.254
console(dhcp-config)# host hardware-address aa:bb:cc:dd:ee:ff dns-server 192.168.45.113

```

### Privileged EXEC mode commands

Command line prompt in the Privileged EXEC mode is as follows:

```
console#
```

Table 186 — Privileged EXEC mode commands

| Command                                             | Value/Default value | Action                                                                                                                                                                                         |
|-----------------------------------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>clear ip dhcp server binding</b><br>[ip_address] | -                   | Delete entries from the correspondence table of physical addresses and addresses issued from the pool by the DHCP server:<br>- <i>ip_address</i> — the IP address assigned by the DHCP server. |
| <b>clear ip dhcp server statistics</b>              | -                   | Delete the statistics of the DHCP server operation.                                                                                                                                            |
| <b>show ip dhcp server binding</b>                  | -                   | View IP addresses that are mapped to physical addresses of clients, as well as the rental time, the method of assignment and the status of IP addresses.                                       |
| <b>show ip dhcp server information</b>              | -                   | View information about the configuration of the DHCP server.                                                                                                                                   |

|                                       |   |                                                                                                         |
|---------------------------------------|---|---------------------------------------------------------------------------------------------------------|
| <b>show ip dhcp server pools</b>      | - | View information about global DHCP server settings, as well as created pools and existing host entries. |
| <b>show ip dhcp server statistics</b> | - | View the statistics of the DHCP server.                                                                 |

## 4.24 PPPoE Intermediate Agent configuration

The PPPoE IA function is implemented in accordance with the requirements of the DSL Forum TR-101 document and is intended for use on switches operating at the access level.

The function allows supplementing PPPoE Discovery packets with information describing the access interface. This is necessary to identify the user interface on the access server (BRAS, Broadband Remote Access Server). The interception and processing of PPPoE Active Discovery packets is managed globally for the entire device and selectively for each interface.

The implementation of the PPPoE IA function provides additional capabilities for monitoring protocol messages by assigning trusted interfaces.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 187 — Global configuration mode commands

| <b>Command</b>                                 | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>shutdown pppoe intermediate-agent</b>       | -/enabled                  | Disable the operation of the pppoe intermediate-agent module on the device.<br><br> <b>The command disables the operation of the pppoe intermediate-agent module and permanently deletes all settings of the PPPoE IA block.</b> |
| <b>no shutdown pppoe intermediate-agent</b>    |                            | Enable the operation of the pppoe intermediate-agent module on the device.                                                                                                                                                                                                                                          |
| <b>pppoe-ia snooping</b>                       | -/off                      | Globally enable the control of the PPPoE IA function.                                                                                                                                                                                                                                                               |
| <b>no pppoe-ia snooping</b>                    |                            | Disable the PPPoE IA function control.                                                                                                                                                                                                                                                                              |
| <b>pppoe-ia snooping session timeout range</b> | range: (0..600)/300        | Set a timeout for the PPPoE IA function to work.                                                                                                                                                                                                                                                                    |
| <b>pppoe-ia snooping session timeout 0</b>     |                            | Disable the timeout for the PPPoE IA function.                                                                                                                                                                                                                                                                      |
| <b>pppoe pass-through</b>                      | -/off                      | Enabling the command causes PPPoE packets to pass through the switch as unknown L2 traffic, and makes them "invisible" to IP ACL.                                                                                                                                                                                   |
| <b>no pppoe pass-through</b>                   |                            | Enable parsing of L3 headers encapsulated in PPPoE packets, IP ACL rules begin to work for encapsulated packets.                                                                                                                                                                                                    |

**To ensure the correct operation of PPPoE Intermediate Agent, all PPPoE servers used must be connected to trusted ports of the switch. To add a port to the "trusted" list, use the port-security-state trusted, set port-role uplink commands in the interface configuration mode. To ensure security, all other switch ports are required to be untrusted.**

### VLAN configuration mode commands (range of VLANs)

```
console# configure terminal
console(config)# vlan
console(config-vlan)#
```

Table 188 — Commands of the L2Vlan interface configuration mode

| Command                     | Value/Default value | Action                                                                  |
|-----------------------------|---------------------|-------------------------------------------------------------------------|
| <b>pppoe-ia snooping</b>    | -/off               | Enable monitoring of the PPPoE IA function within the specified VLAN.   |
| <b>no pppoe-ia snooping</b> |                     | Disable the control of the PPPoE IA function within the specified VLAN. |

Example of configuring PPPoE IA in VLAN10 with configuring DCS options on the interface GigabitEthernet0/13.

```

console(config)#pppoe-ia snooping
console(config)#pppoe passthrough
console(config)#dcs information option enable
console(config)#vlan 10
console(config-vlan)#pppoe-ia snooping
console(config-vlan)#exit
console(config)#interface gigabitEthernet 0/13
console(config-if)#switchport general allowed vlan add 10 untagged
console(config-if)#switchport general pvid 10
console(config-if)#dcs agent-circuit-identifier "%v %p %h"
console(config-if)#dcs remote-agent-identifier "%M"
console(config-if)#exit
console(config)#interface gigabitEthernet 0/24
console(config-if)#switchport general allowed vlan add 10
console(config-if)#port-security-state trusted
console(config-if)#set port-role uplink
console(config-if)#exit

```

## 4.25 Access Control List (ACL) configuration

ACL (Access Control List) is a table that defines the rules for filtering incoming and outgoing traffic based on the protocols transmitted in packets, TCP/UDP ports, IP addresses or MAC addresses.

At the moment, the implementation of the ACL is as follows: each ACL contains only 1 rule. Multiple ACLs can be linked to a single interface. The order of rule processing is determined by the priority of the rule specified in the ACL, if the priorities are equal, by the ACL number.

The ACL is automatically removed from the interface when the rule changes in it.

Commands for creating and editing ACLs are available in the global configuration mode.

### Global configuration mode commands

The command line prompt in the global configuration mode:

```
console (config)#
```

Table 189 — Commands for creating and configuring ACLs

| Command                                                                            | Value/Default value                                                       | Action                                                                                                                                                                                            |

In order to activate the ACL, link it to the interface. The interface using the list can be either an Ethernet interface or a group of ports. At the moment, only the incoming (in) direction is supported on the interfaces.

### Ethernet, VLAN interface configuration mode commands

The command line prompt in the Ethernet interface configuration mode:

```
console (config-if) #
```

The command line in the VLAN interface configuration mode looks like:

```
console (config-vlan) #
```

Table 190 — Command for assigning a list to the ACL interface

| <b>Command</b>                                                  | <b>Value/Default value</b>        | <b>Action</b>                                                                                                 |

| <b>ip access-group</b><br><i>access_list_num</i> <b>in</b>      | access_list_num:<br>(1..65535)    | In the settings of a specific physical interface, bind the specified list to the interface.                   |
| <b>no ip access-group</b><br><i>access_list_num</i> <b>in</b>   |                                   | Delete the list from the interface.                                                                           |
| <b>mac access-group</b><br><i>access_list_num</i> <b>in</b>     | access_list_num:<br>(1..65535)    | In the settings of a specific physical interface, the command binds the specified mac list to this interface. |
| <b>no mac access-group</b><br><i>access_list_num</i> <b>in</b>  |                                   | Delete the list from the interface.                                                                           |
| <b>ipv6 access-group</b><br><i>access_list_num</i> <b>in</b>    | access_list_num:<br>(1001..65535) | In the settings of a specific physical interface, bind the specified list to the interface.                   |
| <b>no ipv6 access-group</b><br><i>access_list_num</i> <b>in</b> |                                   | Delete the list from the interface.                                                                           |

### Privileged EXEC mode commands

The command line prompt in the Privileged EXEC mode:

```
console#
```

Table 191 — EXEC mode commands for ACLs

| <b>Command</b>                                                                                                                                                 | <b>Value/Default value</b>            | <b>Action</b>                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------|
| <b>show access-lists</b><br>[ <i>access_list_num</i> ]                                                                                                         | access_list_num: (1-65535) characters | Show ACLs created on the switch.                             |
| <b>show running-config acl</b>                                                                                                                                 | -                                     | Show the block of ACL commands in the device configuration.  |
| <b>show access-group</b> [interface { fastethernet   gigabitethernet   twopointfivegigabitethernet   tengigabitethernet } interface   vlan [ <i>vlan-id</i> ]] | -                                     | Show the ACLs linked to the interface.                       |
| <b>clear</b> {ip   mac} access-list {access_list_num} <b>packet-count</b>                                                                                      | -                                     | Reset the statistics of packets that fall under the ACL rule |

#### 4.25.1 IPv4-based ACL configuration

The section contains the values and descriptions of the main parameters used as part of the commands for IPv4-based ACL configuration. Creation and entry into the editing mode of IPv4-based ACLs is carried out by the command:

```
ip access-list {extended | standart} access-list_num.
```

Table 192 — Commands used to configure ACLs based on IP addressing

| <b>Command</b>                                                                              | <b>Meaning</b>      | <b>Action</b>                                                                                                               |
|---------------------------------------------------------------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>permit</b> <i>protocol</i> {any   source host} {any   destination} [parametr] [priority] | priority: (1-255)/1 | Add a permissive filtering record for the protocol. Packets that meet the entry conditions will be processed by the switch. |
| <b>deny</b> <i>protocol</i> {any   source host} {any   destination} [parametr] [priority]   | priority: (1-255)/1 | Add a forbidding filtering entry for the protocol. Packets that meet the entry conditions will be blocked by the switch.    |

Table 193 — The main parameters used in commands

| <b>Parameter</b>        | <b>Meaning</b>                  | <b>Action</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>permit</b>           | The 'allow' action              | Create a permissive filtering rule in the ACL.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>deny</b>             | The 'prohibit' action           | Create a forbidding filtering rule in the ACL.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>protocol</i>         | Protocol                        | The field is intended to specify the protocol (or all protocols) based on which filtering will be performed. When choosing a protocol, the following options are possible: icmp, ip, tcp, udp, ipv6, ipv6:icmp, ospf, pim, or the numeric value of the protocol, in the range (0 – 255).<br>The IP value is used to match any protocol.                                                                                                                            |
| <i>source</i>           | Source address                  | Determine the IP address of the packet source.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>source_mask</i>      | Source address mask             | The mask applied to the IP address of the packet source. The mask defines the bits of the IP address that should be ignored. Unities must be written to the values of the ignored bits. For example, using a mask, you can define an IP network for the filtering rule. To add the IP network 195.165.0.0 to the filtering rule, you must set the mask value to 255.255.0.0, that is, according to this mask, the first 16 bits of the IP address will be ignored. |
| <i>destination</i>      | Destination address             | Determine the destination IP address of the packet.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>destination_mask</i> | Destination address mask        | The bit mask applied to the destination IP address of the packet. The mask defines the bits of the IP address that should be ignored. Unities must be written to the values of the ignored bits. The mask is used similarly to the source_mask mask.                                                                                                                                                                                                               |
| <i>vlan</i>             | VLAN ID                         | Define the VLAN for which the rule will be applied.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>dscp</i>             | The DSCP field in the L3 header | Define the value of the diffserv DSCP field. Possible message codes of the <b>dscp</b> field are (0 – 63).                                                                                                                                                                                                                                                                                                                                                         |
| <i>priority</i>         | IP priority                     | Determine the priority of IP traffic: (0-7).                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                          |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>message_type</i>      | ICMP protocol message type | The ICMP message code used to filter ICMP packets. The numeric value of the message type, in the range (0 – 255).                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>message_code</i>      | ICMP protocol message code | The ICMP message code used to filter ICMP packets. Possible message codes of the <i>icmp_code</i> field are (0 – 255).                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>destination_port</i>  | UDP/TCP destination port   | Possible values of the TCP/UDP port field: eq, gt, host, lt, range.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>source_port</i>       | UDP/TCP port of the source |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>priority</i>          | Recording priority         | The index specifies the position of the rule in the list and its priority. The smaller the index, the higher the priority of the rule. The range of acceptable values is (1..255).                                                                                                                                                                                                                                                                                                                             |
| <i>optional parametr</i> | Optional parameter         | Optional parameters when configuring the access list:<br>- <b>tos</b> — filtering by ToS byte;<br>- <b>traffic-class</b> — filtering by Traffic Class value;<br>- <b>user-defined</b> — filtering by User-defined bytes;<br>- <b>sub-action</b> — additional action on traffic;<br>- <b>packet-count</b> — enabling the counter for packets that fall under the filtering rule in the ACL list.<br>Additional actions available — modify-vlan (changing VLAN) and nested-vlan (adding an additional VLAN tag). |

In standard ip ACLs, filtering is possible only by prefixes, in extended ACLs — by additional parameters.

After any ACL is bound to an interface, the implicit deny any any rule is applied to that interface.

#### 4.25.2 IPv6-based ACL configuration

The section contains the values and descriptions of the main parameters used as part of the commands for IPv6-based ACL configuration.

Creation and entry into the editing mode of IPv6-based ACLs is carried out by the command:

```
ipv6 access-list extended apv6_access-list.
```

Table 194 — Commands used to configure ACLs based on IP addressing

| Command                                                                                                                                       | Meaning             | Action                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>permit</b> <i>protocol</i> { <i>any</i>   <i>source host</i> } { <i>any</i>   <i>destination</i> } [ <i>parametr</i> ] [ <i>priority</i> ] | priority: (1-255)/1 | Add a permissive filtering record for the protocol. Packets that meet the entry conditions will be processed by the switch. |
| <b>deny</b> <i>protocol</i> { <i>any</i>   <i>source host</i> } { <i>any</i>   <i>destination</i> } [ <i>parametr</i> ] [ <i>priority</i> ]   | priority: (1-255)/1 | Add a forbidding filtering entry for the protocol. Packets that meet the entry conditions will be blocked by the switch.    |

Table 195 — The main parameters used in commands

| Parameter           | Meaning                         | Action                                                                                                                                                                                           |
|---------------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>permit</b>       | The 'allow' action              | Create a permissive filtering rule in the ACL.                                                                                                                                                   |
| <b>deny</b>         | The 'prohibit' action           | Create a forbidding filtering rule in the ACL.                                                                                                                                                   |
| <i>protocol</i>     | Protocol                        | The field is intended to specify the protocol (or all protocols) based on which filtering will be performed. When choosing a protocol, the following options are possible: icmp, tcp, udp, ipv6. |
| <i>source</i>       | Source address                  | Determine the IP address of the packet source.                                                                                                                                                   |
| <i>destination</i>  | Destination address             | Determine the destination IP address of the packet.                                                                                                                                              |
| <i>dscp</i>         | The DSCP field in the L3 header | Determine the value of the diffserv DSCP field. Possible message codes of the <b>dscp</b> field are (0 – 63).                                                                                    |
| <i>message_type</i> | ICMP protocol message type      | The ICMP message code used to filter ICMP packets. The numeric value of the message type, in the range (0 – 255).                                                                                |

|                          |                            |                                                                                                                                                                                                                                     |
|--------------------------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>message_code</i>      | ICMP protocol message code | The ICMP message code used to filter ICMP packets. Possible message codes of the <i>icmp_code</i> field are (0 – 255).                                                                                                              |
| <i>destination_port</i>  | UDP/TCP destination port   | Possible values of the TCP/UDP port field: eq, gt, host, lt, range.                                                                                                                                                                 |
| <i>source_port</i>       | UDP/TCP port of the source |                                                                                                                                                                                                                                     |
| <i>priority</i>          | Recording priority         | The index specifies the position of the rule in the list and its priority. The smaller the index, the higher the priority of the rule. The range of acceptable values is (1..255).                                                  |
| <i>optional_parametr</i> | Optional parameter         | Optional parameters when configuring the access list:<br>- <b>traffic-class</b> — filtering by Traffic Class value;<br>- <b>packet-count</b> — enabling the counter for packets that fall under the filtering rule in the ACL list. |

After any ACL is bound to an interface, the implicit deny any any rule is applied to that interface.

### 4.25.3 MAC-based ACL configuration

This section provides values and descriptions of the main parameters used in the commands for configuring MAC-based ACLs.

Creation and entry into the editing mode of MAC-based ACLs is carried out by the command: **mac access-list extended** *access-list\_num*.

Table 196 — Commands used to configure MAC-based ACL lists

| <b>Command</b>                                                                                                                                                                                                        | <b>Action</b>                                                                                             |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>permit</b> {any   host <i>source source_mask</i> } {any   host <i>destination destination_mask</i> } [ <b>encaptype</b> <i>value</i>   <i>etype_list</i> ] [ <b>priority</b> <i>priority</i> ] [ <b>parametr</b> ] | Add a permissive filtering entry. Packets that meet the entry conditions will be processed by the switch. |
| <b>deny</b> {any   host <i>source source_mask</i> } {any   host <i>destination destination_mask</i> } [ <b>encaptype</b> <i>value</i>   <i>etype_list</i> ] [ <b>priority</b> <i>priority</i> ] [ <b>parametr</b> ]   | Add a forbidding filtering entry. Packets that meet the entry conditions will be blocked by the switch.   |

Table 197 — The main parameters used in commands

| <b>Parameter</b>        | <b>Meaning</b>                                                    | <b>Action</b>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|-------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>permit</b>           | The allow action                                                  | Create a permissive filtering rule in the ACL.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>deny</b>             | The prohibit action                                               | Create a forbidding filtering rule in the ACL.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>source</b>           | Source address                                                    | Specify the MAC address of the packet source.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>source_mask</b>      | The bit mask applied to the IP address of the packet source       | The mask defines the bits of the MAC address that must be ignored. Unities must be written to the values of the ignored bits. For example, using a mask, you can define a range of MAC addresses for a filtering rule. To add all MAC addresses starting from 00:00:02:AA.xx.xx to the filtering rule, set the mask value to FF:FF:FF:FF:00:00, that is, according to this mask, the last 16 bits of the MAC address will not be important for analysis. |
| <b>destination</b>      | Destination address                                               | MAC address of the packet destination.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>destination_mask</b> | The bit mask applied to the MAC address of the packet destination | The mask defines the bits of the MAC address that must be ignored. Unities must be written to the values of the ignored bits. The mask is used similarly to the <i>source_mask</i> .                                                                                                                                                                                                                                                                     |
| <b>vlan</b>             | <i>vlan_id</i> : (0..4095)                                        | The VLAN subnet of the filtered packets.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>cvlan-priority</b>   | <i>cvlan_priority</i> : (0..7)                                    | The class of service (CoS) of filtered packets.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>encaptype</b>        | <i>value</i> : (1..65535)                                         | The encapsulation type for filtered packets.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>priority</b>         | Index of the rule                                                 | The index of the rule in the table, the smaller the index, the higher priority rule 1-255.                                                                                                                                                                                                                                                                                                                                                               |

|                    |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| optional parameter | Optional parameter | Optional parameters when configuring the access list:<br>- <b>user-defined</b> — filtering by User-defined bytes;<br>- <b>sub-action</b> — additional action on traffic;<br>- <b>redirect</b> — redirect a packet that falls under the rule;<br>- <b>packet-count</b> — enable the counter for packets that fall under the filtering rule in the ACL list.<br>Additional actions available are modify-vlan (changing VLAN), nested-vlan (adding an additional VLAN tag) and modify-cvlan (adding an internal VLAN tag). |
|--------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**After any ACL is bound to an interface, the implicit deny any any rule is applied to that interface.**

Example of setting up padi/pado filtering via User-defined offset:

```
console(config)# user-defined offset 1 ethtype 0
console(config)# mac access-list extended 1
console(config-ext-macl)# deny 00:00:00:00:00:01 ff:ff:ff:ff:ff:00 any
user-defined offset1 0x8863 0xffff
console(config-ext-macl)# !
console(config)# interface gigabitethernet 0/1
console(config-if)# mac access-group 1 in
```

To pass the remaining packets on the interface, you need to add a second ACL allowing the passage of packets that do not fall under the padi/pado filtering rule:

```
console(config)# mac access-list extended 2
console(config-ext-macl)# permit any any
console(config-ext-macl)# ex
console(config)# interface gigabitethernet 0/1
console(config-if)# mac access-group 2 in
```

Example of filtering by src/dst IP, src/dst port, tos via User-defined offset:

```
console(config)# user-defined offset 1 ethtype 0
console(config)# ip access-list extended 1010
console(config-ext-nacl)# deny udp 1.1.0.0 255.255.0.0 gt 5000 2.2.2.0
255.255.255.0 lt 7000 traffic-class 0xe0 sub-action modify-vlan 2 user-
defined offset1 0x8864 0xffff
console(config-ext-nacl)# !
console(config)# interface gigabitethernet 0/1
console(config-if)# ip access-group 1010 in
```

To pass the remaining packets on the interface, you need to add a second ACL allowing the passage of packets that do not fall under the padi/pado filtering rule:

```
console(config)# mac access-list extended 2
console(config-ext-macl)# permit any any
console(config-ext-macl)# ex
console(config)# interface gigabitethernet 0/1
console(config-if)# mac access-group 2 in
```

## 4.26 Configuration of DOS attack protection

This class of commands allows blocking some common classes of DoS attacks.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 198 — Global configuration mode commands

| <b>Command</b>  | <b>Value/Default value</b> | <b>Action</b>                                                                                              |
|-----------------|----------------------------|------------------------------------------------------------------------------------------------------------|
| <b>firewall</b> | -/enabled                  | Switch to the configuration mode of the module responsible for the functionality of DoS attack protection. |

Command line prompt is as follows:

```
console(config-firewall)#
```

Table 199 — Firewall functionality configuration mode commands

| <b>Command</b>                               | <b>Value/Default value</b> | <b>Action</b>                                                                                                      |
|----------------------------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>enable</b>                                | -/enabled                  | Enable support for DoS attack protection.                                                                          |
| <b>disable</b>                               |                            | Disable support for DoS attack protection.                                                                         |
| <b>ip tcp inspection syn-fin enable</b>      | -/enabled                  | Enable syn-fin packet detection.                                                                                   |
| <b>no ip tcp inspection syn-fin</b>          |                            | Disable syn-fin packet detection.                                                                                  |
| <b>ip tcp inspection timeout &lt;sec&gt;</b> | sec: (1..65535)/1          | Set a timer for blocking syn-fin packets.                                                                          |
| <b>ip tcp limit syn-flag enable</b>          | -/off                      | Enable the speed limit for incoming TCP traffic with the SYN flag.                                                 |
| <b>ip tcp limit syn-flag disable</b>         |                            | Disable the speed limit for incoming TCP traffic with the SYN flag.                                                |
| <b>notification interval &lt;sec&gt;</b>     | sec: (1..3600)/1           | Set the time interval between SYSLOG messages about exceeding the limit of incoming TCP traffic with the SYN flag. |
| <b>no notification interval</b>              |                            | Set the default value.                                                                                             |

### Interface configuration mode commands

Command line prompt in the interface configuration mode is as follows:

```
console(config-if)#
```

Table 200 — Interface configuration mode commands

| <b>Command</b>                             | <b>Value/Default value</b>    | <b>Action</b>                                                                        |
|--------------------------------------------|-------------------------------|--------------------------------------------------------------------------------------|
| <b>ip tcp limit syn-flag &lt;value&gt;</b> | value: (1-262143) pps/<br>100 | Set the speed limit for incoming TCP traffic with the SYN flag on the interface.     |
| <b>no ip tcp limit syn-flag</b>            |                               | Disable the speed limit for incoming TCP traffic with the SYN flag on the interface. |

### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 201 — EXEC mode commands

| <b>Command</b>                      | <b>Value/Default value</b> | <b>Action</b>                                                                     |
|-------------------------------------|----------------------------|-----------------------------------------------------------------------------------|
| <b>Show running-config firewall</b> | -                          | Show the firewall module configuration.                                           |
| <b>show firewall stats</b>          | -                          | Show statistics on packets processed by the firewall module.                      |
| <b>show firewall tcp-syn-limit</b>  | -                          | Show the current speed limit settings for incoming TCP traffic with the SYN flag. |

## 4.27 Quality of Service — QoS

By default, packet queuing is used on all switch ports using the FIFO method (First In, First Out). During intensive traffic transmission, this method can cause problems since the device ignores all packets that are not in the FIFO queue buffer, and, accordingly, are irretrievably lost. The method that organizes queues by traffic priority solves this problem. The QoS (Quality of service) mechanism implemented in the switches allows organizing eight priority queues of packets depending on the type of data being transmitted.

### 4.27.1 QoS configuration

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 202 — Global configuration mode commands

| <b>Command</b>                                                                                                                                                                                                                                                                                                                     | <b>Value/Default value</b>                                                                                                                                                      | <b>Action</b>                                                                                                                                                                                                                                                                                                                     |

| <b>set meter meter</b>                                                                              | -                                                                       | Set a limit for the flow rate according to the configured algorithm.      |
| <b>no set meter</b>                                                                                 |                                                                         | Remove the limit for the flow rate according to the configured algorithm. |

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 207 — Global configuration mode commands

| Command               | Value/Default value | Action                                             |
|-----------------------|---------------------|----------------------------------------------------|
| <b>meter meter</b>    | meter: (1..255)     | Create a speed limit meter for outgoing traffic.   |
| <b>no meter meter</b> |                     | Remove the speed limit meter for outgoing traffic. |

## Speed limit meter configuration mode commands for incoming traffic

Command line prompt in the configuration mode:

```
console(config-meter) #
```

Table 208 — Commands of the speed limit meter configuration mode

| <b>Command</b>                                                                                                                         | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

An example of service policy application:

For traffic with DSCP 8, VLAN changes to 100, p-bit changes to 7, dscp changes to 63, the flow rate is limited to 512 kbps.

```

console(config)# ip access-list extended 1008
console(config-ext-nacl)# permit ip any any traffic-class 8 sub-action mod-
ify-vlan 100
console(config-ext-nacl)# !
console(config)# interface gigabitethernet 0/6
console(config-if)# qos trust cos
console(config-if)# switchport mode trunk
console(config-if)# ip access-group 1008 in
console(config-if)# !
console(config)# interface gigabitethernet 0/7
console(config-if)# switchport mode trunk
console(config-if)# qos map regen-priority-type vlanPri enable
console(config-if)# !
console(config)# class-map 1008
console(config-cls-map)# match access-group ip-access-list 1008
console(config-cls-map)# set class 1008 regen-priority 7 group-name QOS
console(config-cls-map)# !
console(config)# meter 10
console(config-meter)# meter-type avgRate cir 512 kbps
console(config-meter)# !
console(config)# policy-map 1008
console(config-ply-map)# set policy class 1008 default-priority-type ipDscp
63

```

### Ethernet or port group interface (interface range) configuration mode commands

Command line prompt in the Ethernet or port group interface configuration mode is as follows:

```
console(config-if)#
```

Table 210 — Ethernet and port group interface configuration mode commands

| Command                              | Value/Default value         | Action                                                                                                                                                        |
|--------------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rate-limit input</b> <i>rate</i>  | rate: (16..4194288)<br>kbps | Set a rate limit for incoming traffic.                                                                                                                        |
| <b>no rate-limit input</b>           |                             | Set the default value.                                                                                                                                        |
| <b>rate-limit output</b> <i>rate</i> | rate: (16..4194288)<br>kbps | Set a speed limit for outgoing traffic.                                                                                                                       |
| <b>no rate-limit output</b>          |                             |  <b>The rate value must be a multiple of 16.</b><br>Set the default value. |

Example of configuring the speed limit of the GigabitEthernet 0/4 port:

```

console# configure terminal
console(config)# vlan 10
console(config-vlan)# vlan active
console(config-vlan)# !
console(config)# interface gigabitethernet 0/4
console(config-if)# switchport mode access
console(config-if)# switchport access vlan 10
console(config-if)# rate-limit input 512

```

```
console(config-if)# rate-limit output 512
```

QoS configuration example:

Configure the scheduler using the wrr algorithm for the outgoing fa0/1 interface. Distribute traffic according to the CoS field in queue 1-4. Assign wrr weight to queues according to the queue number. Declare queue 5 a priority.

```
console(config)# scheduler 10 interface fastethernet 0/1 sched-algo wrr
console(config)# scheduler 20 interface fastethernet 0/1 sched-algo
strict-priority

console(config)# queue 1 interface fastethernet 0/1 scheduler 10 weight 1
console(config)# queue 2 interface fastethernet 0/1 scheduler 10 weight 2
console(config)# queue 3 interface fastethernet 0/1 scheduler 10 weight 3
console(config)# queue 4 interface fastethernet 0/1 scheduler 10 weight 4
console(config)# queue 5 interface fastethernet 0/1 scheduler 10

console(config)# queue-map regn-priority vlanPri 1 queue-id 1
console(config)# queue-map regn-priority vlanPri 2 queue-id 2
console(config)# queue-map regn-priority vlanPri 3 queue-id 3
console(config)# queue-map regn-priority vlanPri 4 queue-id 4
console(config)# queue-map regn-priority vlanPri 5 queue-id 5
```

## 4.28 Configuring routing protocols

Hardware routing is supported only on MES2424, MES2424B, MES2424FB, MES2424P, MES2410-08DP, MES2410-08DU, MES2448, MES2448B, MES2448P, MES2420-48P, MES2420B-24D, MES2411X, MES3400-24, MES3400-24F, MES3400-48, MES3400-48F, MES3710P.

### 4.28.1 Configuring static routing

Static routing is a type of routing in which routes are specified explicitly when configuring the router. All routing in this case takes place without any routing protocols.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 211 — Ethernet and port group interface configuration mode commands

| Command                                                                                                       | Value/Default value                                                                         | Action                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip route</b> <i>prefix</i> { <i>ip_mask</i>   <i>prefix_length</i> } [ <i>gateway</i> ]                    | <i>prefix_length</i> : (0..32);<br><i>distance</i> (1..255)/1<br><i>vlan_id</i> : (1..4094) | Create a static routing rule.<br>- <i>prefix</i> — destination network (for example, 172.7.0.0);<br>- <i>mask</i> — network mask (in decimal format);<br>- <i>gateway</i> — gateway for accessing the destination network;<br>- <i>distance</i> — route weight;<br>- <i>vlan_id</i> — set if the destination network is directly connected to the interface corresponding to the <i>vlan_id</i> . |
| <b>no ip route</b> [ <i>all</i>   <i>prefix</i> { <i>ip_mask</i>   <i>prefix_length</i> } [ <i>gateway</i> ]] |                                                                                             | Delete a rule from the static routing table.<br>- <i>all</i> — remove all rules from the static routing table.                                                                                                                                                                                                                                                                                    |

## EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 212 — EXEC mode commands

| Command                                                                                                                                        | Value/Default value | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### 4.28.2 Configuring Virtual Router Redundancy Protocol (VRRP)

**Supported only on MES2424, MES2424B, MES2424FB, MES2424P, MES2410-08DP, MES2410-08DU, MES2448, MES2448B, MES2448P, MES2420-48P, MES2420B-24D, MES2411X, MES3400-24, MES3400I-24, MES3400-24F, MES3400-48, MES3400-48F, MES3710P.**

VRRP is designed for backup of routers acting as default gateways. This is achieved by joining IP interfaces of the group of routers into one virtual interface which will be used as the default gateway for the computers of the network. At the channel level, redundant interfaces have a 00:00:5E:00:01:XX MAC address, where XX is the VRRP group number (VRID).

Only one of the physical routers can route traffic on the virtual IP interface (VRRP master), the other routers in the group are reserved (VRRP backup). The VRRP master is selected in accordance with RFC 5798. If the current master becomes unavailable, the master selection is repeated. The router with its own IP address that matches the virtual one has the highest priority. In case of availability, it always becomes a VRRP master. The maximum number of VRRP processes is 32.

## Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 213 — Global configuration mode commands

| Command                       | Value/Default value | Action                                                                                                                                                    |
|-------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrrp enable</b>            | -/off               | Enable VRRP globally.                                                                                                                                     |
| <b>no vrrp enable</b>         |                     |  <b>In order for VRRP to work on interfaces, enable VRRP globally.</b> |
| <b>vrrp version {v2   v3}</b> | -/v2                | Delete a rule from the static routing table.<br>Set the VRRP version.                                                                                     |

## VLAN interface configuration mode commands

Command line prompt in the VLAN interface configuration mode is as follows:

```
console(config-if)#
```

Table 214 — VLAN interface configuration mode commands

| Command                                                  | Value/Default value                                                                                   | Action                                                                                                                                                                                                                                                                                                                                                                                         |

### 4.28.3 Configuring the OSPFv2 protocol

OSPF (Open Shortest Path First) — a dynamic routing protocol based on link-state technology and Dijkstra's algorithm used to find the shortest path. The OSPF protocol is an Internal Gateway Protocol (IGP). The OSPF protocol distributes information about available routes between routers of the same autonomous system.

### Global configuration mode commands for OSPFv2

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 216 — OSPFv2 global configuration mode commands

| Command     | Value/Default value | Action                                       |
|-------------|---------------------|----------------------------------------------|
| router ospf | -/-                 | Enter the OSPFv2 process configuration mode. |

### OSPFv2 process mode commands

Command line prompt in the OSPFv2 process configuration mode:

```
console(config-router) #
```

Table 217 — OSPFv2 process configuration mode commands

| Command                                                                               | Value/Default value      | Action                                                                                                                                                                                                                                                                                       |

#### 4.28.4 Configuring the OSPFv3 protocol

##### Global configuration mode commands for OSPFv3

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 220 — OSPFv3 global configuration mode commands

| Command          | Value/Default value | Action                                       |
|------------------|---------------------|----------------------------------------------|
| ipv6 router ospf | -/-                 | Enter the OSPFv3 process configuration mode. |

##### OSPFv3 process mode commands

Command line prompt in the OSPFv3 process configuration mode:

```
console(config-router)#
```

Table 221 — OSPFv3 process configuration mode commands

| Command                                   | Value/Default value                                                    | Action                                                                                                                                                                                                                            |
|-------------------------------------------|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| shutdown                                  | -/disabled                                                             | Disable the OSPF process.<br> <b>The OSPF process is disabled by default.</b>                                                                    |
| no shutdown                               |                                                                        | Enable the OSPF process.                                                                                                                                                                                                          |
| nssa asbr default-route-<br>translator    | -/off                                                                  | Enable default route translation (set the P-bit) in NSSA to ASBR, which is not an ABR.                                                                                                                                            |

### **4.28.5 Configuring the RIP protocol**

RIP (Routing Information Protocol) is a routing information protocol related to internal routing protocols of the remote vector type.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 224 — Global configuration mode commands

| <b>Command</b>    | <b>Value/Default value</b> | <b>Action</b>                             |
|-------------------|----------------------------|-------------------------------------------|
| <b>router rip</b> | -/-                        | Enter the RIP process configuration mode. |

## RIP process mode commands

Command line prompt in the RIP process configuration mode is as follows:

```
console(config-router)#
```

Table 225 — RIP process configuration mode commands

| <b>Command</b>                                                                                                                                                        | <b>Value/Default value</b>                                                                       | <b>Action</b>                                                                                                                                                                                       |

| <b>show ip rip statistics</b>                                   | -                          | Show general statistics and statistics on interfaces.                                                                |

## 4.29 Software update from TFTP Server

The TFTP server must be running and configured on the computer from which the software will be downloaded. The server must have permission to read bootloader and/or system software files. A computer with a running TFTP server must be accessible to the switch (check by running the ping command A.B.C.D on the switch, where A.B.C.D is the IP address of the computer).

Software updates can only be performed by a privileged user.

Updating the software from a USB drive is only possible for devices with a USB port.

### 4.29.1 Updating the system software

The device is loaded from the system software file, which is stored in flash memory. When updating, a new system software file is saved in a specially allocated memory area. When booting, the device launches the active system software file.

Software update procedure:

Copy the new software file to the device in the allocated memory area. Command format:

```
console# copy tftp://tftp_ip_address/[directory]/filename image
```

Or a command:

```
console# firmware upgrade tftp://tftp_ip_address/[directory]/filename
```

Example of a command to download software via sftp:

```
console# copy
sftp://username:password@Tftp_ip_address//[directory]/filename image
```

Example of a command to download software from a USB drive:

```
console# copy usb://[directory]/filename image
```

The new software version will become active after the switch is restarted.

To view data about software versions and their activity, enter the **show bootvar** command:

```
console# show bootvar
```

## 4.30 Debugging mode

Debugging mode allows removing additional diagnostic information from the device.

### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config) #
```

Table 228 — Global configuration mode commands

| Command                                                                                                                    | Value/Default value | Action                                                                                      |
|----------------------------------------------------------------------------------------------------------------------------|---------------------|---------------------------------------------------------------------------------------------|
| debug iss enable { init-shut   management-trc   data-path-trc   cntrl-plane-trc   dump-trc   os-resource-trc   all-fail }  | -/disable           | Enable the generation of debugging messages for a specific block of the iss system module.  |
| debug iss disable { init-shut   management-trc   data-path-trc   cntrl-plane-trc   dump-trc   os-resource-trc   all-fail } |                     | Disable the generation of debugging messages for a specific block of the iss system module. |

### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 229 — EXEC mode commands

| Command                             | Value/Default value                          | Action                                                                                                    |
|-------------------------------------|----------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| no debug all                        | -                                            | Disable the output of all debugging messages.                                                             |
| dump sockets                        | -                                            | View all sockets in the system.                                                                           |
| dump mem location [len byte]        | location: (1..0xffffffff);<br>byte: (1..256) | Show the contents of the memory from the specified memory area.                                           |
| dump {task   sem   que} name [name] | -                                            | Show details of a task, queue, or semaphore when assigning a task name.<br>- name — the name of the task. |
| debug test mem alloc bytes          | bytes: (1..4294967295)                       | Allocate a block of memory with a specified size in bytes.                                                |
| debug test mem free                 | -                                            | Release the allocated memory block.                                                                       |
| debug show sensor temperature index | index: (0..3)                                | Show the temperature sensor values.                                                                       |

## EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 230 — EXEC mode commands

| <b>Command</b>                                                                                                                                                                                               | <b>Value/Default value</b>                                                                                | <b>Action</b>                                                                       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>debug np module</b> { all   aps   cfa   eth   fw   igs   ip   iss   isspi   l2app   la   mau   mlds   mstp   pnac   qosx   rstp   tcam   vct   vlan } [level {all   errors   general   polling}]          | -                                                                                                         | Enable the generation of debugging messages for the NPAPI of the specified module.  |
| <b>no debug np module</b> { all   aps   cfa   eth   fw   igs   ip   iss   isspi   l2app   la   mau   mlds   mstp   pnac   qosx   rstp   tcam   vct   vlan }                                                  |                                                                                                           | Disable the generation of debugging messages for the NPAPI of the specified module. |
| <b>debug show vlan np port</b> [fastethernet <i>fa_port</i>   gigabitethernet <i>gi_port</i>   twopointfivegigabitethernet <i>two_port</i>   tengigabitethernet <i>te_port</i>   port-channel <i>group</i> ] | fa_port: (0/1..24);<br>gi_port:(0/1..48);<br>two_port: (0/1..8);<br>te_port: (0/1..11);<br>group: (1..24) | Show the configuration of the NPAPI port.                                           |
| <b>debug show ip arp np interfaces</b>                                                                                                                                                                       | -                                                                                                         | Show the ARP interface tree in NPAPI.                                               |

### 4.30.1 Debugging commands for interfaces

This debugging mode sets traces for interfaces for the specified severity level.

## EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 231 — EXEC mode commands

| <b>Command</b>                                | <b>Value/Default value</b> | <b>Action</b>                                                                                              |
|-----------------------------------------------|----------------------------|------------------------------------------------------------------------------------------------------------|
| <b>debug interface all severity</b>           | severity: (0..7)/-         | Enable the generation of debugging messages for all types of traces.                                       |
| <b>no debug interface all</b>                 |                            | Disable generation of debugging messages for interfaces.                                                   |
| <b>debug interface arp-pkt-dump severity</b>  | severity: (0..7)/-         | Enable ARP packet dump traces.                                                                             |
| <b>no debug interface arp-pkt-dump</b>        |                            | Disable ARP packet dump traces.                                                                            |
| <b>debug interface buffer severity</b>        | severity: (0..7)/-         | Enable the generation of debug messages for the packet buffer.                                             |
| <b>no debug interface buffer</b>              |                            | Disable the generation of debug messages for the packet buffer.                                            |
| <b>debug interface enet-pkt-dump severity</b> | severity: (0..7)/-         | Enable Ethernet packet dump traces.                                                                        |
| <b>no debug interface enet-pkt-dump</b>       |                            | Disable Ethernet packet dump traces.                                                                       |
| <b>debug interface fail-all severity</b>      | severity: (0..7)/-         | Enable the generation of debugging messages when all types of failures occur, including packet validation. |
| <b>no debug interface fail-all</b>            |                            | Disable generation of debugging messages when failures occur.                                              |

|                                                       |                    |                                                              |
|-------------------------------------------------------|--------------------|--------------------------------------------------------------|
| <b>debug interface ip-pkt-dump</b><br><i>severity</i> | severity: (0..7)/- | Enable IP packet dump traces.                                |
| <b>no debug interface ip-pkt-dump</b>                 |                    | Disable IP packet dump traces.                               |
| <b>debug interface os</b><br><i>severity</i>          | severity: (0..7)/- | Enable generation of debugging messages for OS resources.    |
| <b>no debug interface os</b>                          |                    | Disable generation of debugging messages for OS resources.   |
| <b>debug interface track</b><br><i>severity</i>       | severity: (0..7)/- | Enable generation of debugging interface tracking messages.  |
| <b>no debug interface track</b>                       |                    | Disable generation of debugging interface tracking messages. |
| <b>debug interface trc-error</b><br><i>severity</i>   | severity: (0..7)/- | Enable generation of debugging interface error messages.     |
| <b>no debug interface trc-error</b>                   |                    | Disable generation of debugging interface error messages.    |

### 4.30.2 VLAN debugging

#### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 232 — EXEC mode commands

| <b>Command</b>                  | <b>Value/Default value</b> | <b>Action</b>                                                                                       |
|---------------------------------|----------------------------|-----------------------------------------------------------------------------------------------------|
| <b>debug vlan all-debug</b>     | -                          | Enable generation of all VLAN module debugging messages.                                            |
| <b>no debug vlan all-debug</b>  |                            | Disable generation of all VLAN module debugging messages.                                           |
| <b>debug vlan all-module</b>    | -                          | Enable generation of debugging messages related to priority, redundancy, and traffic transmission.  |
| <b>no debug vlan all-module</b> |                            | Disable generation of debugging messages related to priority, redundancy, and traffic transmission. |
| <b>debug vlan buffer</b>        | -                          | Enable generation of vlan buffer debugging messages.                                                |
| <b>no debug vlan buffer</b>     |                            | Disable generation of vlan buffer debugging messages.                                               |
| <b>debug vlan ctpl</b>          | -                          | Enable generation of vlan management debugging messages.                                            |
| <b>no debug vlan ctpl</b>       |                            | Disable generation of vlan management debugging messages.                                           |
| <b>debug vlan data</b>          | -                          | Enable generation of vlan data exchange debugging messages.                                         |
| <b>no debug vlan data</b>       |                            | Disable generation of vlan data exchange debugging messages.                                        |
| <b>debug vlan dump</b>          | -                          | Enable generation of vlan packet capture debugging messages.                                        |
| <b>no debug vlan dump</b>       |                            | Disable generation of vlan packet capture debugging messages.                                       |
| <b>debug vlan failall</b>       | -                          | Enable generation of vlan error debugging messages.                                                 |
| <b>no debug vlan failall</b>    |                            | Disable generation of vlan error debugging messages.                                                |
| <b>debug vlan fwd</b>           | -                          | Enable generation of vlan traffic transmission debugging messages.                                  |
| <b>no debug vlan fwd</b>        |                            | Disable generation of vlan traffic transmission debugging messages.                                 |
| <b>debug vlan global</b>        | -                          | Enable the generation of vlan module debugging messages globally                                    |
| <b>no debug vlan global</b>     |                            | Disable the generation of vlan module debugging messages globally                                   |
| <b>debug vlan initshut</b>      | -                          | Enable generation of debugging messages for changing the state of the vlan module.                  |
| <b>no debug vlan initshut</b>   |                            | Disable generation of debugging messages for changing the state of the vlan module.                 |
| <b>debug vlan mgmt</b>          | -                          | Enable generation of vlan management debugging messages.                                            |

|                          |       |                                                                                     |
|--------------------------|-------|-------------------------------------------------------------------------------------|
| no debug vlan mgmt       |       | Disable generation of vlan management debugging messages.                           |
| debug vlan os            | -     | Enable generation of debugging messages for vlan module resources, except buffers.  |
| no debug vlan os         |       | Disable generation of debugging messages for vlan module resources, except buffers. |
| debug vlan priority      | -     | Enable generation of vlan priority debugging messages.                              |
| no debug vlan priority   |       | Disable generation of vlan priority debugging messages.                             |
| debug vlan redundancy    | -     | Enable generation of vlan redundancy debugging messages.                            |
| no debug vlan redundancy |       | Disable generation of vlan redundancy debugging messages.                           |
| debug garp               | -/off | Enable debugging of the GARP protocol.                                              |
| no debug garp            |       | Disable debugging of the GARP protocol.                                             |

### 4.30.3 Debugging Ethernet-oam

#### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 233 — EXEC mode commands

| <b>Command</b>                   | <b>Value/Default value</b> | <b>Action</b>                                                       |
|----------------------------------|----------------------------|---------------------------------------------------------------------|
| debug ethernet-oam all           | -                          | Enable generation of all eoam debugging messages.                   |
| no debug ethernet-oam all        |                            | Disable generation of all eoam debugging messages.                  |
| debug ethernet-oam buffer        | -                          | Enable generation of eoam buffer messages.                          |
| no debug ethernet-oam buffer     |                            | Disable generation of eoam buffer messages.                         |
| debug ethernet-oam config        | -                          | Enable generation of eoam configuration messages.                   |
| no debug ethernet-oam config     |                            | Disable generation of eoam configuration messages.                  |
| debug ethernet-oam ctrl          | -                          | Enable generation of eoam control messages.                         |
| no debug ethernet-oam ctrl       |                            | Disable the generation of eoam control messages.                    |
| debug ethernet-oam discovery     | -                          | Enable generation of eoam neighbor detection process messages.      |
| no debug ethernet-oam discovery  |                            | Disable the generation of eoam neighbor detection process messages. |
| debug ethernet-oam failure       | -                          | Enable generation of eoam error messages.                           |
| no debug ethernet-oam failure    |                            | Disable generation of eoam error messages.                          |
| debug ethernet-oam func-entry    | -                          | Enable generation of eoam function login messages.                  |
| no debug ethernet-oam func-entry |                            | Disable generation of eoam function login messages.                 |
| debug ethernet-oam func-exit     | -                          | Enable generation of eoam function exit messages .                  |
| no debug ethernet-oam func-exit  |                            | Disable generation of eoam function exit messages.                  |
| debug ethernet-oam init          | -                          | Enable generation of the eoam module status change messages.        |
| no debug ethernet-oam init       |                            | Disable generation of status change messages for the eoam module.   |
| debug ethernet-oam lm            | -                          | Enable link-monitor eoam message generation.                        |
| no debug ethernet-oam lm         |                            | Disable link-monitor eoam message generation.                       |
| debug ethernet-oam loopback      | -                          | Enable remote-loopback eoam message generation.                     |
| no debug ethernet-oam loopback   |                            | Disable remote-loopback eoam message generation.                    |
| debug ethernet-oam mux-parser    | -                          | Enable mux-parser eoam status message generation.                   |

|                                  |   |                                                                   |
|----------------------------------|---|-------------------------------------------------------------------|
| no debug ethernet-oam mux-parser |   | Disable mux-parser eoam status message generation.                |
| debug ethernet-oam pkt           | - | Enable message generation for the eoam packet.                    |
| no debug ethernet-oam pkt        |   | Disable message generation for the eoam packet.                   |
| debug ethernet-oam redundancy    | - | Enable generation of eoam redundancy messages.                    |
| no debug ethernet-oam redundancy |   | Disable generation of eoam redundancy messages.                   |
| debug ethernet-oam resource      | - | Enable message generation for eoam resources other than buffers.  |
| no debug ethernet-oam resource   |   | Disable message generation for eoam resources other than buffers. |
| debug ethernet-oam rfi           | - | Enable generation of eoam remote alarm detection messages.        |
| no debug ethernet-oam rfi        |   | Disable generation of eoam remote alarm detection messages.       |
| debug ethernet-oam var-resp      | - | Enable generation of eoam response request value messages.        |
| no debug ethernet-oam var-resp   |   | Disable generation of eoam response request value messages.       |

#### 4.30.4 Logging debug messages

This command block is used to configure debug logging parameters in the system.

The log name contains the date of its creation on flash.

#### Global configuration mode commands

Command line prompt in the global configuration mode is as follows:

```
console(config)#
```

Table 234 — Global configuration mode commands

| Command                                          | Value/Default value  | Action                                                                                                                                                                                                                                                                 |
|--------------------------------------------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| debug-logging { console   file   buffered-file } | -                    | Redirect the output of debugging messages to a specific location.<br><b>console</b> — to the console terminal;<br><b>file</b> — to a separate file on flash;<br><b>buffered-file</b> — to a separate buffer or to a flash file, when the buffer resource is exhausted. |
| no debug-logging                                 |                      | Set the default value.                                                                                                                                                                                                                                                 |
| debug-logging log-path {flash_url}               | flash:/LogDir/Debug/ | Set the location of the file where debug messages are written.                                                                                                                                                                                                         |
| no debug-logging log-path                        |                      | Set the default value.                                                                                                                                                                                                                                                 |

Information about the debug-logging log-path is stored in the nvram file. To return the default directory, use the no debug-logging log-path or delete startup command.

When using the clear logs debug file command, the entire contents of the directory where the log files are located are deleted. It is recommended to use a separate directory or the default directory for storing logs in order to avoid losing configuration files.

The debug-logging console and debug-logging {file | buffered-file} commands can work together

## EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 235 — EXEC mode commands

| <b>Command</b>               | <b>Value/Default value</b> | <b>Action</b>                                         |
|------------------------------|----------------------------|-------------------------------------------------------|
| <b>clear logs debug file</b> | -                          | Clear the contents of the directory with debug files. |

### **4.30.5 Commands for debugging control functions**

## EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 236 — EXEC mode commands

| <b>Command</b>                                                                            | <b>Value/Default value</b> | <b>Action</b>                                                               |
|-------------------------------------------------------------------------------------------|----------------------------|-----------------------------------------------------------------------------|
| <b>debug radius {all   errors   events   packets   responses   timers}</b>                | -/off                      | Enable generation of debugging messages for the RADIUS protocol.            |
| <b>no debug radius</b>                                                                    |                            | Disable generation of debugging messages for the RADIUS protocol.           |
| <b>debug tacacs {all   dump   dump   errors   info}</b>                                   | -/off                      | Enable generation of debugging messages for the TACACS protocol.            |
| <b>no debug tacacs</b>                                                                    |                            | Disable generation of debugging messages for the TACACS protocol.           |
| <b>debug ssh {all   duffer   ctrl   data   dump   mgmt   resource   server   shut}</b>    | -/off                      | Enable generation of debugging messages for SSH.                            |
| <b>no debug ssh {all   duffer   ctrl   data   dump   mgmt   resource   server   shut}</b> |                            | Disable generation of debugging messages for SSH.                           |
| <b>debug terminal take</b>                                                                | -/off                      | Enable the output of debugging messages in the current SSH/Telnet session.  |
| <b>no debug terminal take</b>                                                             |                            | Disable the output of debugging messages in the current SSH/Telnet session. |

### **4.30.6 Commands for debugging the DHCP protocol**

The commands in this block include the DHCP module tracking.

## EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 237 — EXEC mode commands

| <b>Command</b>                                                                    | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                 |
|-----------------------------------------------------------------------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>debug ip dhcp snooping {all   critical   entry   exit   debug   fail}</b>      | -/off                      | Enable generation of debugging messages for the DHCP Snooping function.                                                                                       |
| <b>no debug ip dhcp snooping {all   critical   entry   exit   debug   fail}</b>   |                            | Disable generation of debugging messages for the DHCP Snooping function.                                                                                      |
| <b>debug ip dhcp client all</b>                                                   | -/off                      | Enable generation of all debugging messages for the DHCP client function.                                                                                     |
| <b>no debug ip dhcp client all</b>                                                |                            | Disable generation of all debugging messages for the DHCP client function.                                                                                    |
| <b>debug ip dhcp client {bind   errors   event   packets}</b>                     | -/off                      | Enable generation of selective debugging messages for the DHCP client function.                                                                               |
| <b>no debug ip dhcp client {bind   errors   event   packets}</b>                  |                            | Disable generation of selective debugging messages for the DHCP client function.                                                                              |
| <b>debug ip dhcp relay {all   errors}</b>                                         | -/off                      | Enable generation of debugging messages for the DHCP relay function:<br>- <b>all</b> — all debugging messages;<br>- <b>errors</b> — debugging error messages. |
| <b>no debug ip dhcp relay {all   errors}</b>                                      |                            | Disable generation of debugging messages for the DHCP relay function.                                                                                         |
| <b>debug ip dhcp server {all   bind   errors   events   linkage   packets}</b>    | -/off                      | Enable generation of selective debugging messages for the DHCP server function.                                                                               |
| <b>no debug ip dhcp server {all   bind   errors   events   linkage   packets}</b> |                            | Disable generation of selective debugging messages for the DHCP server function.                                                                              |
| <b>debug show ip dhcp np interfaces</b>                                           | -                          | Show the configuration of the control function of the DHCP protocol.                                                                                          |

### 4.30.7 Debugging the PPPoE-IA function

#### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 238 — EXEC mode commands

| <b>Command</b>                              | <b>Value/Default value</b> | <b>Action</b>                                                              |
|---------------------------------------------|----------------------------|----------------------------------------------------------------------------|
| <b>debug pppoe intermediate-agent all</b>   | -                          | Enable generation of all PPPoE-IA debugging messages.                      |
| <b>no debug pppoe intermediate-agent</b>    |                            | Disable generation of all PPPoE-IA debugging messages.                     |
| <b>debug pppoe intermediate-agent entry</b> | -                          | Enable generation of debug messages about logging into PPPoE-IA functions. |
| <b>no debug pppoe intermediate-agent</b>    |                            | Disable generation of all PPPoE-IA debugging messages.                     |
| <b>debug pppoe intermediate-agent exit</b>  | -                          | Enable generation of debug messages about the exit of PPPoE-IA functions.  |
| <b>no debug pppoe intermediate-agent</b>    |                            | Disable generation of all PPPoE-IA debugging messages.                     |
| <b>debug pppoe intermediate-agent fail</b>  | -                          | Enable generation of PPPoE-IA debugging error messages.                    |
| <b>no debug pppoe intermediate-agent</b>    |                            | Disable generation of all PPPoE-IA debugging messages.                     |

|                                    |   |                                                                 |
|------------------------------------|---|-----------------------------------------------------------------|
| debug pppoe intermediate-agent pkt | - | Enable generation of debugging messages about PPPoE-IA packets. |
| no debug pppoe intermediate-agent  |   | Disable generation of all PPPoE-IA debugging messages.          |

### 4.30.8 DCS function debugging

#### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 239 — EXEC mode commands

| Command         | Value/Default value | Action                                                                    |
|-----------------|---------------------|---------------------------------------------------------------------------|
| debug dcs all   | -                   | Enable generation of all eoam debugging messages.                         |
| no debug dcs    |                     | Disable generation of all dcs debugging messages.                         |
| debug dcs entry | -                   | Enable generation of debugging messages about logging into dcs functions. |
| no debug dcs    |                     | Disable generation of all dcs debugging messages.                         |
| debug dcs exit  | -                   | Enable generation of debugging messages about exiting dcs functions.      |
| no debug dcs    |                     | Disable generation of all dcs debugging messages.                         |
| debug dcs fail  | -                   | Enable generation of dcs error debugging messages.                        |
| no debug dcs    |                     | Disable generation of all dcs debugging messages.                         |

### 4.30.9 QoS function debugging

#### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 240 — EXEC mode commands

| Command                | Value/Default value | Action                                                                             |
|------------------------|---------------------|------------------------------------------------------------------------------------|
| debug qos buffer       | -                   | Enable generation of debugging messages for QoS buffers.                           |
| no debug qos buffer    |                     | Disable generation of debugging messages for QoS buffers.                          |
| debug qos ctrl         | -                   | Enable generation of debugging messages for QoS management.                        |
| no debug qos ctrl      |                     | Disable generation of debugging messages for QoS management.                       |
| debug qos dump         | -                   | Enable generation of debugging messages for QoS packets.                           |
| no debug qos dump      |                     | Disable generation of debugging messages for QoS packets.                          |
| debug qos failall      | -                   | Enable generation of debugging messages for QoS errors.                            |
| no debug qos failall   |                     | Disable generation of debugging messages for QoS errors.                           |
| debug qos init-shut    | -                   | Enable generation of debugging messages for changing the state of the QoS module.  |
| no debug qos init-shut |                     | Disable generation of debugging messages for changing the state of the QoS module. |
| debug qos mgmt         | -                   | Enable generation of debugging messages for QoS management.                        |
| no debug qos mgmt      |                     | Disable generation of debugging messages for QoS management.                       |

|                              |   |                                                                                |
|------------------------------|---|--------------------------------------------------------------------------------|
| <b>debug qos os</b>          | - | Enable generation of debugging messages for QoS resources other than buffers.  |
| <b>no debug qos os</b>       |   | Disable generation of debugging messages for QoS resources other than buffers. |
| <b>debug show qos meters</b> | - | Show information about the number of allocated and free QoS Meters.            |

#### 4.30.10 Commands for debugging the SNTP protocol

The commands in this block allow removing additional diagnostic information for the SNTP protocol.

##### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 241 — EXEC mode commands

| <b>Command</b>                                                                                  | <b>Value/Default value</b> | <b>Action</b>                                               |
|-------------------------------------------------------------------------------------------------|----------------------------|-------------------------------------------------------------|
| <b>debugsntp {all   all-fail   buff   control   data-path   init-shut   mgmt   resource}</b>    | -/off                      | Enable generation of debugging messages of the SNTP block.  |
| <b>no debugsntp {all   all-fail   buff   control   data-path   init-shut   mgmt   resource}</b> |                            | Disable generation of debugging messages of the SNTP block. |

#### 4.30.11 Commands for debugging the STP protocol

The commands in this block allow getting additional diagnostic information for the STP protocol.

##### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 242 — EXEC mode commands

| <b>Command</b>                           | <b>Value/Default value</b> | <b>Action</b>                                                                                                                                                                            |
|------------------------------------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>debug spanning-tree global</b>        | -/off                      | Enable generation of debugging messages for the STP protocol globally.                                                                                                                   |
| <b>no debug spanning-tree global</b>     |                            | Set the default value.                                                                                                                                                                   |
| <b>debug spanning-tree all</b>           | -/off                      | Enable generation of all debugging messages for the STP protocol.                                                                                                                        |
| <b>no debug spanning-tree all</b>        |                            | Set the default value.                                                                                                                                                                   |
| <b>debug spanning-tree errors</b>        | -/off                      | Enable generation of debugging messages for the STP protocol for error diagnostics.                                                                                                      |
| <b>no debug spanning-tree errors</b>     |                            | Set the default value.                                                                                                                                                                   |
| <b>debug spanning-tree init-shut</b>     | -/off                      | Enable generation of debugging messages for the STP protocol for init and shutdown. This trace is generated when the STP module is initialized or closed unsuccessfully or successfully. |
| <b>no debug spanning-tree init-shut</b>  |                            | Set the default value.                                                                                                                                                                   |
| <b>debug spanning-tree management</b>    | -/off                      | Enable generation of debugging messages when managing the STP protocol. Debugging messages are generated every time STP functions are configured.                                        |
| <b>no debug spanning-tree management</b> |                            | Set the default value.                                                                                                                                                                   |
| <b>debug spanning-tree memory</b>        | -/off                      | Enable generation of sending debugging messages in case of unsuccessful and successful memory allocation for the STP process.                                                            |

|                                                                                                                                                                            |                   |                                                                                                                                                             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no debug spanning-tree memory                                                                                                                                              |                   | Set the default value.                                                                                                                                      |

### 4.30.12 Commands for debugging the LLDP protocol

The commands in this block allow removing additional diagnostic information for the LLDP protocol.

#### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 243 — EXEC mode commands

| Command                                                                                                                                                                                                                                                    | Value/Default value | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### 4.30.13 Commands for debugging the IGMP Snooping function

The commands in this block allow capturing additional diagnostic information for the IGMP protocol.

#### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 244 — EXEC mode commands

| <i>Command</i>                                                          | <i>Value/Default value</i> | <i>Action</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

#### 4.30.14 Debugging for port-channel

##### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 245 — EXEC mode commands

| <i>Command</i>                     | <i>Value/Default value</i> | <i>Action</i>                                                                  |
|------------------------------------|----------------------------|--------------------------------------------------------------------------------|
| <b>debug lacp all</b>              | -                          | Enable generation of all debugging messages for LACP.                          |
| <b>no debug lacp all</b>           |                            | Disable generation of all debugging messages for LACP.                         |
| <b>debug lacp buffer</b>           | -                          | Enable generation of debugging messages by LACP buffers.                       |
| <b>no debug lacp buffer</b>        |                            | Disable generation of debugging messages by LACP buffers.                      |
| <b>debug lacp data</b>             | -                          | Enable generation of LACP data exchange debugging messages.                    |
| <b>no debug lacp data</b>          |                            | Disable generation of LACP data exchange debugging messages.                   |
| <b>debug lacp events</b>           | -                          | Enable generation of debugging messages by LACP events.                        |
| <b>no debug lacp events</b>        |                            | Disable generation of debugging messages by LACP events.                       |
| <b>debug lacp failall</b>          | -                          | Enable generation of debugging messages by LACP errors.                        |
| <b>no debug lacp failall</b>       |                            | Disable generation of debugging messages by LACP errors.                       |
| <b>debug lacp init-shutdown</b>    | -                          | Enable generation of debugging messages for changing the LACP state.           |
| <b>no debug lacp init-shutdown</b> |                            | Disable generation of debugging messages for changing the LACP state.          |
| <b>debug lacp mgmt</b>             | -                          | Enable generation of debugging messages by LACP control messages.              |
| <b>no debug lacp mgmt</b>          |                            | Disable generation of debugging messages by LACP control messages.             |
| <b>debug lacp os</b>               | -                          | Enable generation of debugging messages by LACP resources, excluding buffers.  |
| <b>no debug lacp os</b>            |                            | Disable generation of debugging messages by LACP resources, excluding buffers. |
| <b>debug lacp packet</b>           | -                          | Enable generation of debugging messages for LACP packets.                      |
| <b>no debug lacp packet</b>        |                            | Disable generation of debugging messages for LACP packets.                     |

### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 246 — EXEC mode commands

| <i>Command</i>                      | <i>Value/Default value</i> | <i>Action</i>                                                          |
|-------------------------------------|----------------------------|------------------------------------------------------------------------|
| <b>debug etherchannel all</b>       | -                          | Enable generation of all debugging messages for LAG.                   |
| <b>no debug etherchannel all</b>    |                            | Disable generation of all debugging messages for LAG.                  |
| <b>debug etherchannel detail</b>    | -                          | Enable generation of detailed debugging messages for LAG.              |
| <b>no debug etherchannel detail</b> |                            | Disable generation of detailed debugging messages for LAG.             |
| <b>debug etherchannel error</b>     | -                          | Enable generation of LAG error debugging messages.                     |
| <b>no debug etherchannel error</b>  |                            | Disable generation of LAG error debugging messages.                    |
| <b>debug etherchannel event</b>     | -                          | Enable generation of debugging messages by LAG events.                 |
| <b>no debug etherchannel event</b>  |                            | Disable generation of debugging messages by LAG events.                |
| <b>debug etherchannel idb</b>       | -                          | Enable generation of debugging messages by LAG interface descriptors.  |
| <b>no debug etherchannel idb</b>    |                            | Disable generation of debugging messages by LAG interface descriptors. |

#### 4.30.15 Debugging loopback-detection

##### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 247 — EXEC mode commands

| <b>Command</b>                                  | <b>Value/Default value</b> | <b>Action</b>                                                   |
|-------------------------------------------------|----------------------------|-----------------------------------------------------------------|
| <b>debug loopback-detection all</b>             | -                          | Enable generation of all LBD debugging messages.                |
| <b>no debug loopback-detection all</b>          |                            | Disable generation of all LBD debugging messages.               |
| <b>debug loopback-detection buffer-alloc</b>    | -                          | Enable generation of debugging messages for LBD buffers.        |
| <b>no debug loopback-detection buffer-alloc</b> |                            | Disable generation of debugging messages for LBD buffers.       |
| <b>debug loopback-detection control</b>         | -                          | Enable generation of LBD control debugging messages.            |
| <b>no debug loopback-detection control</b>      |                            | Disable generation of LBD control debugging messages.           |
| <b>debug loopback-detection pkt-dump</b>        | -                          | Enable generation of LBD packet capture debugging messages.     |
| <b>no debug loopback-detection pkt-dump</b>     |                            | Disable generation of LBD packet capture debugging messages.    |
| <b>debug loopback-detection pkt-flow</b>        | -                          | Enable generation of debugging messages for LBD traffic flows.  |
| <b>no debug loopback-detection pkt-flow</b>     |                            | Disable generation of debugging messages for LBD traffic flows. |

#### 4.30.16 Debugging for the SNMP protocol

##### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 248 — EXEC mode commands

| <b>Command</b>       | <b>Value/Default value</b> | <b>Action</b>                                          |
|----------------------|----------------------------|--------------------------------------------------------|
| <b>debug snmp</b>    | -                          | Enable generation of all debugging messages for SNMP.  |
| <b>no debug snmp</b> |                            | Disable generation of all debugging messages for SNMP. |

#### 4.30.17 Commands for TCAM parameter diagnostics

The commands in this block allow capturing additional diagnostic information for TCAM.

##### EXEC mode commands

Command line prompt in the EXEC mode is as follows:

```
console#
```

Table 249 — EXEC mode commands

| Command                                                                                                                                                                               | Value/Default value                                                                    | Action                                                                                                                                                                                                                                           |

## APPENDIX B. QUEUES FOR TRAFFIC RECEIVED ON THE CPU

Table B.1 – Queue allocation for CPU-received traffic for MES1428, MES2428, MES2408, MES3708P

| <i>Service</i>                                                                                                | <i>Queue number</i> |
|---------------------------------------------------------------------------------------------------------------|---------------------|
| DHCP relay, Firewall (notification of the beginning of an attack), L2PT, EOAM                                 | 1                   |
| Port Security (notification of exceeding the limit), unregistered multicast (IP based IGMP/MLD snooping mode) | 2                   |
| DHCP client, DHCPv4/v6 snooping, IPv6 NDP                                                                     | 3                   |
| ARP, PPPoE IA                                                                                                 | 4                   |
| EAPOL, IGMP/MLD snooping                                                                                      | 5                   |
| Traffic from the switch MAC DA                                                                                | 6                   |
| Reserved                                                                                                      | 7                   |
| BPDU, LBD, Slow Protocol (LACP)                                                                               | 8                   |

Table B.2 – Queue allocation for CPU-received traffic for MES2424, MES2424B, MES2424P, MES2410-08DP, MES2410-08DU, MES2448, MES2448B, MES2448P, MES2420-48P, MES2420B-24D, MES2411X, MES3400-24, MES3400I-24, MES3400-24F, MES3400-48, MES3400-48F, MES3710P

| <i>Service</i>                                         | <i>Queue number</i> |
|--------------------------------------------------------|---------------------|
| Other traffic                                          | 1                   |
| Firewall (notification of the beginning of the attack) | 2                   |
| Unregistered multicast (in IP based IGMP/MLD mode)     | 7                   |
| Port Security (notification of exceeding the limit)    | 8                   |
| DHCP Client/Snooping                                   | 12                  |
| PPPoE IA Snooping                                      | 12                  |
| DHCP Server/Relay                                      | 15                  |
| EAPOL                                                  | 16                  |
| L2 Protocol Tunneling                                  | 16                  |
| LLDP                                                   | 18                  |
| OAM                                                    | 20                  |
| ipv6 nd inspection                                     | 21                  |
| ARP Inspection                                         | 22                  |
| IGMP/MLD Snooping                                      | 24                  |
| Packets from the switch MAC DA                         | 25                  |
| Slow protocols (LACP)                                  | 30                  |
| BPDU                                                   | 31                  |
| Loopback detection                                     | 31                  |
| Stacking                                               | 32                  |

## APPENDIX D. DECODING THE LIST OF PROCESSES

| Title | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| TMR#  | Managing timers                                                                 |
| PKTT  | Periodic packet sending (not currently in use, only supports Heart Beat)        |
| VcmT  | Stack event handling (not currently in use)                                     |
| SMT   | SYSLOG                                                                          |
| CFA   | Initial packet processing, port status monitoring                               |
| IPDB  | IP Binding Database Management (for ARP Inspection and IP Source Guard)         |
| L2DS  | DHCP Snooping                                                                   |
| BOXF  | SFP status Monitoring                                                           |
| ERRD  | Errdisable                                                                      |
| ELMT  | Port monitoring for Ethernet OAM                                                |
| EOAT  | The main Ethernet OAM stream                                                    |
| FMGT  | Ethernet OAM Fault Management, event handling in a hardware environment         |
| AST   | STP                                                                             |
| PIf   | IEEE 802.1x                                                                     |
| LaTT  | LAG, LACP                                                                       |
| CNMT  | MAC Notification                                                                |
| VLAN  | The main stream of the VLAN module                                              |
| FDBP  | Synchronization with a hardware MAC table                                       |
| SnpT  | IGMP/MLD Snooping                                                               |
| QoS   | The main flow of the QoS module                                                 |
| SMGT  | Monitoring of the hardware environment (RAM, FLASH, fans, power supplies, etc.) |
| CPUU  | CPU utilization monitoring                                                      |
| BAKP  | Auto-save configuration                                                         |
| RT6   | IPv6 routing                                                                    |
| IP6   | Processing IPv6 packets                                                         |
| PNG6  | Ping v6                                                                         |
| RTM   | IPv4 routing                                                                    |
| IPFW  | Processing IPv4 packets                                                         |
| UDP   | Processing UDP packets                                                          |
| ARP   | Processing ARP packets                                                          |
| PNG   | Ping v4                                                                         |
| SLT   | Managing sockets                                                                |
| SAT   | SNMP server                                                                     |
| TCP   | Processing TCP packets                                                          |
| RAD   | RADIUS client                                                                   |
| TACT  | TACACS client                                                                   |
| DHRL  | DHCP Relay                                                                      |
| DHC   | DHCP client protocol                                                            |
| DCS   | Listening to a socket for a DHCP client                                         |
| PIA   | PPPoE Intermediate Agent                                                        |
| L2SN  | IPv6 RA Guard                                                                   |
| CLIC  | CLI                                                                             |
| CTS   | TELNET server                                                                   |

|            |                                                                      |
|------------|----------------------------------------------------------------------|
| SSH        | SSH server                                                           |
| LLDP       | LLDP                                                                 |
| LBD        | Loopback detection                                                   |
| LOGF       | Logging debug messages                                               |
| SNT        | SNTP                                                                 |
| STOC       | Storm Control                                                        |
| HWPK       | Measuring port utilization                                           |
| MSR        | Configuration file management, file upload/download, firmware update |
| C[200-999] | A temporary thread for processing a separate TELNET/SSH connection   |

## TECHNICAL SUPPORT

For technical assistance in issues related to operation of ELTEX Enterprise Ltd. equipment, please contact the Service Center:

The feedback form on the website: <https://eltex-co.com/support/>

Visit ELTEX official website to get the relevant technical documentation and software, benefit from our knowledge base, send us an online request or consult a Service Center Specialist:
